

At-A-Glance:

A Summary of HIV/AIDS in Fresno County (2020)

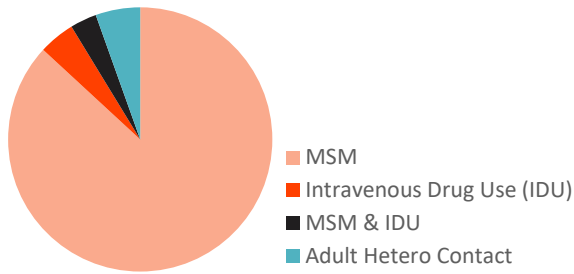

Figure 1. Fresno County Most Likely Route of Transmission of HIV (2013–2020). Most of the HIV transmission in the county has been linked to men who have sex with men (e.g., MSM), representing 70.5% of total new cases.

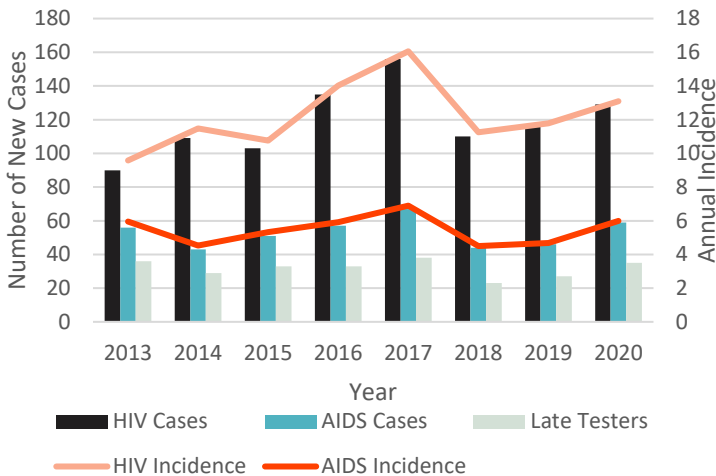

Figure 2. Fresno County HIV Incident Cases by Age (2020). Under 35 years of age represent nearly 50% of all new HIV cases occurring in Fresno County.

Figure 3. Fresno County's HIV/AIDS Trends by Year. This figure shows the number of new cases by year and its corresponding incidence rate. "Late Testers" are qualified as individuals who converted from HIV to AIDS within 12 months of first HIV+ diagnosis. Fresno County had 35 Late Testers in the year 2020, up from 27 in 2018.

¹ Incidence is calculated per 100,000 persons

Table 1. Fresno County HIV/AIDS Prevalence by Race & Ethnicity (2020).

The total number of cases is higher in the Hispanic and White categories. However, the prevalence is highest amongst Blacks/African Americans, in both the HIV and AIDS categories.

Race/Ethnicity:	Prevalence ¹ (N) ²	
	HIV	AIDS
American Indian/ Alaskan Native	--	--
Asian/Pacific Islander	38.7 (39)	44.7 (45)
Black/African American	339.3 (150)	418.5 (185)
Hispanic/Latino ³	111.6 (583)	120.4 (629)
White	93.6 (271)	94.9 (275)

Note: Some numbers have been censored due to low counts. Race/Ethnicity was not specified for 1.9% of HIV cases and 1.9% of AIDS cases in the 2019 year. Rates were calculated using 2019 American Community Survey population estimates due to a lack of 2020 data at time of report.

¹Prevalence is calculated per 100,000 persons

²N represents the total cases in that category

³Hispanic or Latino may include people from any races (i.e. American Indian/Alaskan Native, Asian/Pacific Islander, Black, White, and Multi-Racial)

Figure 4. Fresno County's Incident Cases of HIV by Gender and Year. This figure shows the number of new cases, by year and gender, as well as its corresponding incidence rate.

While the incidence of females in Fresno County has remained relatively steady, the male incidence has been more variable. Males experienced an upward trend from 2015-2017, a decrease in incidence from 2018-2019, with a slight increase again in 2020.

¹ Incidence is calculated per 100,000 persons of that gender
