FOUNDATION REPORT
JACALITOS CREEK BRIDGE REPLACEMENT PROJECT ON LOST HILLS ROAD
(BR. NO. 42C0078)
FRESNO COUNTY, CALIFORNIA

1.0 INTRODUCTION

This Foundation Report (FR) is prepared for the proposed Jacalitos Creek Bridge Replacement Project (Project) in Fresno County (County), California. The approximate location of the Project site is shown on Plate 1 in Appendix I. The work was performed in general accordance with the scope of work outlined in our proposal to Consor (Designer/Structure Designer).

The scope of work performed for this investigation included a review of the readily available soils and geologic literature pertaining to the Project site and the information from the draft Foundation Report prepared by Wreco (dated May 2016). During the current design phase, PARIKH conducted supplemental geotechnical explorations and laboratory testing, performed engineering analyses, and prepared this report. Our geotechnical recommendations are based on the available boring data (PARIKH, 2024, Wreco, 2016, and Moore & Taber, 1969) and the design input provided by the Designer.

The purpose of this report is to evaluate the general subsurface soil conditions at the Project site, evaluate their engineering properties, and provide foundation design recommendations for the proposed Project.

2.0 PROJECT DESCRIPTION

The bridge is located in a rural area of the County (at approx. 36°06'07.2"N/120°18'38.8"W). The existing Jacalitos Creek Bridge is a five-span structure that is about 97 feet long and 28 feet wide. The bridge is supported on various foundation types, including spread footings (Abutment 1, Bent 2, and Bent 3) and driven steel H piles (10BP42, at Bent 4, Bent 5, and Abutment 6).

The proposed bridge will be a three-span structure that is about 140 feet long and 32 feet wide. It is planned to use Cast-In-Drilled-Hole (CIDH) piles for foundation support.

3.0 GEOTECHNICAL INVESTIGATION

PARIKH reviewed the draft Foundation Report prepared by Wreco (2016), which includes four borings (A-16-001 to A-16-004) from about 50.8 to 51.5 feet deep. Four borings (Borings B-1, B-2, B-3, and P-1) were drilled by More & Taber in 1969 from about 15 to 45 feet deep; however, these borings can not be accurately located since the site plan lacks scale and reference points.

Since the pile tip elevations are expected to be lower than the available boring data per the preliminary analyses according to the draft Foundation Report (Wreco, 2016), PARIKH

conducted a supplemental boring in 2024 to 90.5 feet below the ground surface. The boring by PARIKH was advanced by using a truck-mounted drill rig with 5½-inch solid-stem augers and the rotary wash method. Soils encountered in the borings were sampled using a 1.4-inch I.D. Standard Penetration Test (SPT) sampler under the impact of a 140 lb automatic hammer falling 30 inches. Based on the information provided by the driller, the hammer efficiency is approximately 82%.

The boring was drilled under the technical supervision of our field geologist, who classified and logged the soils encountered during drilling and supervised the collection of soil samples at various depths for visual examination and laboratory testing. The blow counts required to drive the sampler for the last 12 inches, or portion thereof are presented on the "Log of Test Borings" (LOTB), Appendix II. After visual examination, the collected samples were sealed and transported to our laboratory for further evaluation and testing.

The logs of the test borings were prepared from the field logs which were edited based on a visual re-examination of the soil samples in the laboratory and results of classification tests performed on selected soil and rock samples as indicated on the logs. Abrupt stratum changes shown on the logs may be gradual and relatively minor changes in soil types within a stratum may not be noted on the logs due to field limitations.

The approximate boring locations are shown on Plate 2 in Appendix I. The table below summarizes the field exploration information.

Table 1 – Summary of Field Explorations

Exploration ID.	Approximate Ground Surface Elevation (ft) [4]	Total Exploration Depth (ft)	Hammer Energy	Completion Date
R-24-001 [1]	667.0	90.5	82%	2/01/2024
A-16-001A & A-16-001B [2]	669.5	51.5	87%	3/22/2016
A-16-002 [2]	669.5	51.5	87%	3/22/2016
A-16-003 [2]	660.0	50.8	87%	3/21/2016
A-16-004 [2]	670.0	50.5±	87%	3/22/2016
B-1 [3]	690.9	45.5±	n.a.	3/7/1969
B-2 [3]	669.8	29.5±	n.a.	3/10/1969
B-3 [3]	669.1	44.5±	n.a.	3/13/1969
P-1 [3]	688.9	15±	n.a.	n.a.

Notes:
(1) Parikh, 2024
(2) Draft LOTB by Wreco, 2016.
(3) Moore & Taber, 1969. However, the locations of the borings cannot be determined.
(4) The location of the current boring by Parikh was not surveyed. The ground surface elevation for R-24-001 was estimated based on the topography data provided by the designer.

It should be noted that the descriptions of the soils encountered and relevant soil boring information presented on the LOTBs depict subsurface conditions only at the locations indicated on the plan and on the date noted on the LOTBs. Because of the variability from place to place within the soil in general, subsurface conditions at other locations may differ from conditions occurring at the soil boring locations explored. The abrupt stratum changes shown on the logs may be gradational, and relatively minor changes in soil types within a stratum may not be noted on the logs due to field limitations. Also, the passage of time may result in a change in the soil conditions at these locations due to environmental or anthropogenic changes.

4.0 LABORATORY TESTING PROGRAM

Laboratory tests were performed on selected soil samples recovered from Boring R-24-001 to evaluate the physical and engineering properties of the subsoil, including Moisture Contents (ASTM D2216), Particle Size Analysis (ASTM D422), Atterberg Limits (ASTM D4318), and Corrosivity Testing (CTM 643, 422, and 417). The laboratory test results are attached in Appendix III.

5.0 GEOTECHNICAL CONDITIONS

5.1 Geology

The Project site is located at the transition between the Coast Ranges and the Great Central Valley Geomorphic Provinces. Geologic unit extents and descriptions have been derived from “Dibblee and Minch, (2006), “Geologic map of the Kreyenhagen Hills quadrangle, Fresno County, California”, Dibblee Foundation Map DF-277. Project site geology is shown in Plate 3.

The Project is mapped to be underlain by Holocene surficial sediments (Qa) composed of alluvial gravel, sand, silt, and clay. This unit correlates well with the units described in the LOTB included in Appendix II.

Pleistocene older surficial sediments (Qoa) are mapped as occurring to the southeast of the project and are composed of alluvial gravel, sand, and clay.

Depth to bedrock was not revealed during this investigation. Given this, the Tulare Formation (QTt) occupies the hills to the northwest and southwest of the project. The unit dips slightly to moderately to the northeast and possibly underlies the project at depths greater than about 100 feet. The unit is described as being poorly indurated and composed of pebble to cobble conglomerate, sand, and clay. The unit would likely not be amenable to rock coring.

5.2 Surface Conditions

The site is contained in the bed and floodplain of Jacalitos Creek which flows from southwest to northeast through the site. Site topography slopes gently to the northeast.

Historical aerial photographs suggest the location of the bed and main channel of Jacalitos Creek has changed significantly over the last 95 years or so. The main channel of the creek upstream of the current bridge appears to have swept to the northwest and is currently abutting against and flowing along West Lost Hills Road from about 300 feet northeast of the bridge.

Geologic and elevation data relative to the Project site do not indicate the presence of geologic hazards such as landslides, slope failure, or rockfalls.

5.3 Subsurface Conditions

Based on the available boring data, the site is generally underlain by medium dense to very dense granular materials, including silty sand, well-graded sand, and poorly-graded sand. A layer of sandy lean clay was encountered at about Elev. 660 feet in Boring R-24-001, A-16-004, and A-16-001A, which is above the planned foundations. The approximate borehole locations are shown in Plate 2, and the soil/rock descriptions encountered are presented on the Log of Test Borings in Appendix III.

Due to limitations inherent in geotechnical investigations, it is neither uncommon to encounter unforeseen variations in the soil conditions during construction nor is it practical to determine all such variations during an acceptable program of drilling and sampling for a project of this scope. Such variations, when encountered, generally require additional engineering services to attain a properly constructed project. We, therefore, recommend that a contingency fund be provided to accommodate any additional charges resulting from technical services that may be required during Project construction.

6.0 GROUNDWATER

Boring B-3 (1969) encountered groundwater at Elev. 655.6 feet, which is about 13.5 feet deep. However, groundwater was not encountered in the auger borings conducted in the previous investigation phase (Wreco, 2016) to the maximum boring depth of 51.5 feet at about Elev. 609.5 feet. Groundwater was not encountered before the field explorations switched to rotary wash drilling in Boring R-24-001.

We have reviewed the groundwater data from the SGMA Data Viewer website (California Department of Water Resources, DWR), the groundwater is reported at about Elev. 280 feet according to the Spring 2023 data. Therefore, the groundwater table is expected to be relatively deep due to the groundwater pumping in the Central Valley in the past few decades.

Based on the above, natural groundwater may not exist within the exploration depths. Perched water may exist, which could also be affected by the seasonal water level in the creek and underground seepage. Therefore, it is recommended that a reduced soil unit weight be considered to about 10 feet below the bottom of the pile caps to account for the saturation condition due to the water in the creek for design purposes under the Service and Strength Limit States.

Please note that groundwater may vary with the passage of time due to seasonal groundwater fluctuation, surface and subsurface flows, seepage, ground surface run-off, and other factors that may not be present at the time of the investigation.

7.0 AS-BUILT FOUNDATION DATA

According to the Bridge Inspection Report (dated October 30, 2023) provided by the County, the existing spans 1 to 3, i.e., Abutment 1, Bent 2, and Bent 3, were part of the original structure constructed in 1940. Spread footings were used at these supports, but the actual footing dimensions and the design bearing capacities are not known.

Spans 4 and 5, i.e., Bent 4, Bent 5, and Abutment 6, were re-built in 1970, and steel driven H-piles (10BP42) were used for foundation support. The design pile tip were at Elev. 634 feet for the bents and Elev. 640 feet for Abutment 6; however, the design capacities are not available.

8.0 SCOUR DATA

The designer provided the following scour information that was considered for the foundation design.

Table 2 – Scour Information

Support No.	Long-Term Scour Elevation (Degradation and Contraction) (ft)	Short Term (Local) (ft)
Abutment 1	652	6.3
Bent 2	652	10.8
Bent 3	652	11.9
Abutment 4	652	11.6

According to Table 3.7.5-1 of the AASHTO Load and Resistant Factor Design (LRFD) Bridge Design Specifications, 8th Edition (AASHTO LRFD BDS 2017) with California Amendments, the effects due to 100% channel degradation/aggradation and contraction scour plus 100% local scour shall be considered at the Service limit state; 100% channel degradation/aggradation and contraction scour plus 50% local scour shall be considered in Strength limit state load combinations. For the Extreme Event I limit state, 100% degradation/aggradation and 100%

contraction scour should be considered, but local scour should not be included in structural or geotechnical design.

9.0 CORROSION EVALUATION

One corrosion test result was available from the 2016 report. Two more tests were conducted during this design phase from the samples collected in Boring R-24-001, and the test results are presented in Appendix III.

The test results are summarized below in Table 3. Based on Caltrans' standards, the site is considered non-corrosive.

Table 3 – Corrosion Test Results

Exploration ID.	Approximate Sample Depth (ft)	Minimum Resistivity (ohm-cm)	pH	Chloride (ppm)	Sulfate (ppm)	Corrosive?
R-24-001	11	1420	7.99	21.6	51.3	No
R-24-001	20	910	8.03	36.6	75.3	No
A-15-003	30.0 - 31.5	3,480	8.50	3.4	18.6	No

Note: Caltrans currently defines a corrosive environment as an area where the soil has either a chloride concentration of 500 ppm or greater, a sulfate concentration of 1,500 ppm or greater, or has a pH of 5.5 or less. With the exception of MSE walls, soil and water are not tested for chlorides and sulfates if the minimum resistivity is greater than 1,500 ohm-cm.

10.0 SEISMIC INFORMATION

The Project lays within one of the most seismically active areas of North America and is influenced mostly by the San Andreas fault system which spans the Coast Ranges from the Pacific Ocean to the San Joaquin Valley. The bridge is located at coordinates of approximately 36.10196°N and 120.31078°W. Plate 4 shows active faults in relation to the Project.

The closest active faults to the Project are the Great Valley thrust fault system, the Nunez, and the San Andreas.

The closest surface trace of the historically aged (<150 years) Kettleman Hills-North Dome (Great Valley 14) section of the Great Valley thrust fault system lays about 9.7 miles at a bearing of 80° from the project. The location of this section is poorly constrained and has a thrust displacement. The fault section is approximately 18 miles long, strikes approximately 300°, and dips 22° to the west.

The closest surface trace of the historically aged Coalinga (Great Valley 13) section of the Great Valley thrust fault system lays about 10.2 miles at a bearing of 45° from the project. The location of this section is poorly constrained and has a thrust displacement. The fault section is approximately 24 miles long, strikes approximately 300°, and dips 10° to 15° the south-west.

The closest surface trace of the historically aged Nunez fault lays about 10.3 miles at a bearing of 359° from the project. The location of this section is inferred and right-lateral strike-slip displacement. The fault section is approximately 4 miles long and strikes approximately 359°.

The closest surface trace of the historically aged San Andreas fault zone lays about 14.6 miles at a bearing of 225° from the project. The location of this section is well-constrained and has a right-lateral strike-slip displacement. The fault strikes approximately 317° and dips vertically.

10.1 Ground Motion Hazard

The site is susceptible to earthquake-induced ground motions during the design life of the bridge. According to the draft foundation report by Wreco (2016), the time-average shear wave velocity (V_{S30m}) for the upper 100 feet of soil at the site was estimated to be 283 m/sec.

We have re-evaluated the V_{S30m} based on the available data according to the current guidelines per the Caltrans Geotechnical Manual, "Design Acceleration Response Spectrum" module, dated January 2021. The V_{S30m} from the borings near the bridge (Borings A-16-002, A-16-003, A-16-004, and R-24-001) range from about 277 to 315 m/s. To develop the design ARS curve, a V_{S30m} of 280 m/s is assumed.

The Horizontal Peak Ground Acceleration (PGA) Is the ground motion at the site with a 5% probability of exceedance in 50 years (return period = 975 years). The USGS's 2014 NSHM is used as the basis to determine the ground motion. Adjustments for near-fault and basin effects were implemented, when applicable, as per Appendix B of the SDC v2.0. Caltrans web-based tool ARS Online v3.1.0 was utilized to determine the design ground motion parameters, including the ARS, for the subject structure site. Based on the ARS Online v3.1.0 tool, the design PGA = 0.66g, the deaggregated mean earthquake moment magnitude for PGA, M = 6.45, and the mean site-to-source distance for 1.0 second period spectral acceleration, R = 18.8 km (11.7 mi). The soil at the site is "Class S2" per SDC v2.0.

The site location and the relevant parameters are summarized in the table below, and the recommended design ARS curve and the Caltrans ARS Online tool output in Appendix I.

Table 4 – Recommended Ground Motion Parameters for Geotechnical Design

Site Parameters			Design Ground Motion Parameters (Return Period = 975 years)	
Locations (1)		Shear-Wave Velocity v_{S30}, m/sec	Horizontal Peak Ground Acceleration (HPGA) (1), g	Mean Earthquake (1) M, Moment Magnitude
Latitude, degrees	Longitude, degrees			
36.101998°N	120.310775°W	280	0.66	6.45

Note: (1) Based on the Caltrans web tool ARS Online (Version 3.1.0).

10.2 Other Seismic Hazards

Primary seismic hazards include ground shaking and surface fault rupture. Secondary seismic effects resulting from soil responses to ground shaking include liquefaction and landslides. These hazards may cause deformation of man-made structures and are discussed in the following sections. Earthquake-induced ground-shaking is a seismic hazard that can result in liquefaction, lurching, lateral spreading of soils, and landslide of soil and rock as well as the dynamic oscillation of man-made structures.

Differential settlements can occur at the ground surface if subsurface liquefaction and densification occur due to strong ground shaking.

The Project site has been determined to not have the potential for surface fault rupture, liquefaction, seismic-induced slope failure, or tsunami.

10.2.1 Surface Fault Rupture Potential

An Earthquake Zones of Required Investigation map and Seismic Hazard Zone Report have not been prepared for the site enclosing Kreyenhagen Hills 7.5-Minute Quadrangle. Hence, the Project does not lay within an Alquist-Priolo Earthquake Fault Zone or Seismic Hazard Zone.

The USGS Quaternary Fault and Fold Database shows the Project is not located within 1,000 feet of an unzoned fault that is Holocene/Latest Pleistocene (15,000 years) or younger.

In assessing seismic risks, we consider that surface fault rupture does not contribute to the seismic hazards at the site during the useful life of the Project. The preceding statements do not make inferences on the potential for secondary surface cracking.

10.2.2 Liquefaction Potential

Liquefaction is a phenomenon that saturated cohesionless soils are subject to a temporary but essentially total loss of shear strength under the reversing, cyclic shear stresses associated with earthquake shaking. According to the Caltrans Geotechnical Manual, "*Liquefaction Evaluation*" module, dated January 2020, soil types that are susceptible to liquefaction are sand, silty sand, low plasticity (PI<7) silt, and in unusual cases, gravel. Rock and most clay soils are not liquefiable.

Since the soils are predominantly dense granular soils and the natural groundwater table is expected to be relatively deep, the liquefaction potential does not exist. We have evaluated the soil densification (i.e., volumetric compression) due to earthquake-induced ground shaking for the dry cohesionless soil layers present at

the site location per procedures outlined by Tokimatsu and Seed (1987) based on the boring data. The soil densification analysis summary is tabulated below.

Table 5 – Dry Sand Settlement Summary

Boring No.	Estimated Dry Sand Settlement (in)
R-24-001	0.1±
A-16-001	5.0±
A-16-002	0.2±
A-16-003	0.1±
A-16-004	0.1±

The estimated soil densification is generally insignificant within the project limits. However, the results from boring A-16-001 indicate a much greater dry sand settlement due to a low blow count that appears to be localized. Since Boring A-16-001 is located about 85 feet from the proposed bridge abutment and the sample was relatively shallow, the impact due to soil densification is considered insignificant for the proposed bridge.

10.2.3 Seismic Slope Stability / Lateral Spreading Potential

Both static and seismic slope stability analyses were performed for the proposed abutments. The seismic slope stability analyses were performed with a horizontal seismic coefficient (kh) equal to 0.33g (1/2 × PGA) because the abutments will be supported on deep foundations. The analyses yielded factors of safety greater than 1.5 and 1.1 for the static and seismic conditions, respectively. The results of the slope stability analyses are shown in Appendix IV.

In conclusion, seismic slope instability and lateral spreading potential of the proposed abutments seem not to be a design issue due to the results of the slope stability analyses and the non-existing liquefaction potential at the Project site.

11.0 GEOTECHNICAL RECOMMENDATIONS

11.1 General

This report was prepared specifically for the proposed bridge structure as described earlier. Normal procedures were assumed for the construction of the bridge structure throughout our analysis and represent one of the bases of recommendations presented herein. Our design criteria have been based on the materials encountered at the site. Therefore, we should be notified in the event that these conditions are changed, so as to modify or amend our recommendations.

The following recommendations are for the proposed Project as shown on the loads (Appendix IV) and general and foundation plans (Appendix VI) provided by the structure designer.

11.2 Soil Profile

Based on the subsurface soil conditions described in Section 6.3, we have developed the generalized soil profile shown in the table below.

Table 6 – Generalized Soil Profile and LPILE Parameters

Elevation (ft)	Soil Type (L-PILE Soil Type)	Probable Soil Strength (1)	Total Unit Weight (pcf) (2)
660 to 645	Sand (Reese)	$\phi = 36°$	120
645 to 630	Sand (Reese)	$\phi = 40°$	125
630 to 610	Sand (Reese)	$\phi = 36°$	125
610 to 580	Sand (Reese)	$\phi = 40°$	130

Notes:
(1) The default values for K and ε_{50} in LPILE are recommended for analyses.
(2) Groundwater is relatively deep according to the boring data and the DWR groundwater contours. However, it is recommended that the effective unit weight (γ_T-γ_w, γ_w=62.4 pcf) be considered in the upper 10 feet below the creek bottom to account for seasonal saturation due to the flow in the creek for the Service and Strength Limit States.

11.3 Deep Foundations

Per discussion with the structure designer, the proposed bridge structure will be supported on 30-inch and 36-inch diameter CIDH piles at the abutments and the bents, respectively.

Consistent with the Caltrans requirements, the design of the abutment foundations followed the Load and Resistance Factor Design (LRFD) approach. For the proposed structure, pertinent foundation design information provided by the structure designer, the recommended specified pile tip elevations are shown in the Pile Data Tables in Appendix IV per Memo-To-Designers 3-1.

Please note that the design tip elevations and specified tip elevations shown in this report are based on the elevations, the demands, and the scour information provided by the structure designer. If the above design assumptions change, the design pile tip elevations must be verified.

11.3.1 Axial Pile Capacity

The estimation of the capacity of CIDH concrete piles is based on procedures proposed by O'Neill and Reese (1999; FHWA-IF-99-025). We have utilized the computer program “SHAFT” (ENSOFT, ver. 2023) for calculation purposes. The

program utilizes α factors for "Clay" and β factors for "Sand" where β is a function of depths below the ground surface. The pile capacity will be derived primarily from frictional resistance along the pile shafts, and end bearing contribution is not counted. The SHAFT output files are provided in Appendix IV.

Design Considerations:

1. We neglected the skin friction above the scour depth for each case analyzed (i.e., Service-I Limit State, Strength Limit State, and Extreme Event Limit State) as discussed in Section 8.0 of the report.

2. Per discussion in Section 11.2.2, liquefaction potential is not considered in our geotechnical design for the Project.

3. No tension demands based on the design input provided by the structural engineer.

4. Group Effect: Per Table 10.8.3.6.3-1 of the California Amendments to the AASHTO Load and Resistant Factor Design (LRFD) Bridge Design Specifications (AASHTO LRFD BDS), 8th Edition, no reduction due to the group effect is considered for the single row of piles at the bents with center-to-center spacing of 18 feet, which is six times the pile diameter (6D).

   For the abutment, a Reduction Factor for Group Effects (η) of 0.8 was considered when estimating the pile lengths at the abutment where the minimum center-to-center pile spacing is 7.5 feet, which is three times the pile diameter (3D).

11.3.2 Lateral Pile Capacity

Lateral pile analyses were performed by the structure designer based on the geotechnical parameters presented in Table 4. The design considerations are summarized below:

Design Considerations:

1. Group Effect: Per the California Amendments to AASHTO LRFD BDS – 8th Edition (Table 10.7.2.4-1), "p-y Curve Modification Factors" should be adopted for the loading in the transverse and longitudinal directions to account for pile group effect. Based on the plans provided by the structural engineer, the recommended p-multipliers are summarized in the tables below.

Table 7 – P-Multiplier for LPILE Analyses in Longitudinal Direction

Supports	Pile Type	Longitudinal			
		Pile Spacing	Pile Spacing	No. of Rows	p-multiplier
Abut 1	30" dia. CIDH	7.5'	3D	2	0.650
Bent 2	36" dia. CIDH	18'	6D	1	1.000
Bent 3	36" dia. CIDH	18'	6D	1	1.000
Abut 4	30" dia. CIDH	7.5'	3D	2	0.650

Table 8 – P-Multiplier for LPILE Analyses in Transverse Direction

Supports	Pile Type	Transverse			
		Pile Spacing	Pile Spacing	No. of Rows	p-multiplier
Abut 1	30" dia. CIDH	7.5'	3D	5	0.500
Bent 2	36" dia. CIDH	18'	6D	2	0.963
Bent 3	36" dia. CIDH	18'	6D	2	0.963
Abut 4	30" dia. CIDH	7.5'	3D	5	0.500

2. There is no impact on the lateral pile capacity due to liquefaction potential. However, scour should be considered when performing the lateral pile design for the abutments as discussed in Section 8.0.

11.4 Lateral Earth Pressure Capacity

The walls that are free to rotate at least 0.004 radians may be assumed flexible for the active condition. Walls that are not capable of this movement should be assumed rigid and designed for the at-rest condition.

For the proposed seat-type abutments with compacted structural backfill, the active earth pressure can be estimated based on an active earth pressure coefficient, Ka, of 0.283 (based on level backslope and a friction angle of 34 degrees for the compacted Structure Backfill) and a unit weight of 125 pcf. The recommendations are based on the assumption that no hydrostatic pore pressure buildup with well-drained structure backfill behind the walls.

A total seismic active earth pressure coefficient, Kae of 0.54, is recommended based on a kh of 0.33 (=½×PGA of 0.66g) for the pile-supported abutment with a level backslope per Appendix A11 of the AASTO LRFD BDS, 8th Edition.

For the longitudinal stiffness and passive resistance, the abutment walls should be designed based on the bilinear model per Section 6.3.1 of the Caltrans Seismic Design Criteria (SDC, version 2.0, dated April 2019). The bilinear model is based on experimental and calibrated analytical models using engineered structural backfill to relative compaction of at least 95%.

12.0 NOTES FOR SPECIFICATIONS

Caltrans standard specifications for "Cast-in-Place Concrete Piling" (Section 49-3) should be used for the construction of CIDH piles, which include necessary quality assurance and quality control (QA/QC) procedures.

Before using the information provided below in this section, please review the report to comprehend the contents and intent of the geotechnical design.

19-3.03B(1) Surface Water or Groundwater is Expected during Structure Excavation

Water may be expected during excavation and pile installation due to precipitations, surface water, leakage from underground utilities, irrigation of the landscape, seepage, or seasonal flow in the creek at the proposed bridge site. Therefore, this Standard Special Provision (SSP) should be included, and Type D structure excavation is recommended where excavation is expected.

49-1.03 Expected Difficult Pile Installation

The expected difficult pile installation conditions are summarized in the following table.

Table 9 – Expected Difficult Pile Installation

Pile Location		**Conditions**
Structure Number	**Support Location**	
42C0078	All Supports	- Groundwater or perched water should be expected during pile construction. - The pile construction is expected to encounter loose to very dense sand. - The contractor should expect hard drilling due to the presence of very dense sand and gravel. Larger particles, such as cobbles or boulders, may exist that can not be revealed in soil borings of 5 to 7 inches in diameter. However, the boreholes were advanced without rock coring.

49-3.02C(1) Drilling Sequence for CIDH Piling Center-to-Center Spacing less than 4 Pile Diameters

Unless the holes are supported by full-length casing, pile installation should be alternated, i.e. two adjacent piles should not be left open at the same time for pile spacing less than 4 pile diameters.

13.0 NOTES FOR CONSTRUCTION

13.1 General

To a degree, the performance of any structure is dependent upon construction procedures and quality. Hence, observation of grading operations and foundation construction should be carried out by the geotechnical engineer or the responsible agency. If the encountered subsurface conditions differ from those forming the basis of our recommendations, this office should be informed in order to assess the need for design changes.

The recommendations presented in this report are contingent upon good quality control and these geotechnical observations during construction.

Unless otherwise stated in the special provisions, all materials specifications should conform to Caltrans Standard Specifications (2023) including but not limited to the following: Earthwork, Structure Backfill, Reinforcing Geosynthetics, Hot Mix Asphalt, Aggregate Base, Aggregate Subbase, etc.

It is not unusual that unknown old buried utilities or abandoned structures, concrete rubble, etc., exist within the Project limit. It might require special equipment and additional efforts to remove these buried objects. The contractor should verify the utility lines, be aware of the existing conditions, and plan the construction activities accordingly.

In our opinion, conventional equipment may be used to excavate the on-site materials, which primarily consist of dense sand and gravels. Prospective contractors for the Project must evaluate construction-related issues on the basis of their knowledge and experience in the local area, similar projects in other localities, or additional field investigation on the site performed by them, taking into account their proposed construction methods and procedures. In addition, construction activities related to excavation and lateral earth support must conform to the safety requirements of OSHA and other applicable municipal and State regulatory agencies.

It is recommended that the excavations be supported as quickly as practical to maintain the integrity of the cut and prevent surficial sloughing. Generally, if the excavated slope appears loose or unstable, the area of excavation should be limited to that for which excavation, placement of laggings or anchored, mesh, rebar, and shotcrete can be completed in a day. Leaving cuts unsupported for a longer duration may result in instability. Localized subgrade pumping may be encountered during footing excavation depending on the weather, moisture condition of the subsurface soils, and surface drainage conditions.

According to the Caltrans Geotechnical Manual, "Soil Cut Slopes" module, dated January 2020, temporary cuts at 1H:1V are common on Caltrans construction projects and can be considered for this project. However, cuts greater than 25 feet in height are likely to experience problems if they exist for long periods or are exposed to extreme weather events. The design of all temporary cut slopes must follow Cal/OSHA requirements and the Caltrans Trenching and Shoring Manual

Water may be expected during excavation and pile installation due to precipitations, surface water, leakage from underground utilities, irrigation of the landscape, seepage, or seasonal flow in the creek at the proposed bridge site. Equipment mobility may also be difficult if the subgrade is wet. The subgrade soils may require reworking, aeration, or over-excavation and replacement with dry granular fill, and potentially with geotextile or geogrid to facilitate earthwork construction.

Backfill could be required for the narrow voids between the different improvements depending on the construction sequence and the distance between the Project elements. If traditional compaction is not practical or achievable due to the access limitation, self-setting flowable backfill materials, such as slurry cement backfill or controlled low-strength material should be used to fill the voids.

13.2 CIDH Concrete Piles

The calculated "Nominal Resistance" of the CIDH concrete piles was based on side resistance only. Tip resistance was not used. The zones used to calculate the side resistance of the CIDH concrete piles are shown in the table below.

Table 10 – Zones Used to Calculate Side Resistance

Support Location	Top of Side Resistance Zone Elevation (feet)	Bottom of Side Resistance Zone Elevation (feet)	Specified Tip Elevation (feet)
Abutment 1	649	607	605
Bent 2	646	585	583
Bent 3	646	585	583
Abutment 4	646	605	603

Note:
(1) The slurry displacement method may be used for concrete placement of the CIDH piles. Therefore, the specified pile tip elevations are two feet below the design tip elevations to account for the zone of untested concrete due to the limitations of the gamma-gamma logging (GGL) equipment (Caltrans Geotechnical Manual, "CIDH Concrete Pile Design Considerations" Module, dated March 2021.

Due to limitations inherent in the geotechnical investigation, it is neither uncommon to encounter unforeseen variations in the subsurface conditions during construction, nor is it practical to determine all such variations in an acceptable exploration program. Therefore, the contractor should expect the following conditions for the pile construction:

- The contractor should expect hard drilling due to the presence of very dense sand and gravel. Larger particles, such as cobbles or boulders, may exist that can not be revealed in soil borings of 5 to 7 inches in diameter. In addition, caving should be expected within the granular materials. Such caving conditions may require additional drilling and cleaning effort and may increase the concrete volume for the piles. The contractors should be aware of these conditions so that they can take appropriate steps to comply with the standards and maintain the integrity of the piles. The use of temporary casing and/or slurry construction for the pile installation should be anticipated to minimize the construction difficulty due to potential raveling or caving.

- Although the groundwater appears to be relatively deep according to the discussion in Section 6.0, water could be present during the CIDH pile construction. Such a condition may necessitate the use of the slurry displacement method and temporary casings.

- Pile excavations should not be allowed to stand open overnight without full-length casing, and excavations should be poured as soon as practical. Access tubes should be provided to allow for pile integrity testing and construction QA/QC (gamma-gamma logging or cross-hole sonic logging) procedures except for piles constructed in dry holes or holes dewatered without the use of temporary casing to control groundwater.

- The bottom of the abutment excavations should be free of debris and loose materials and properly cleaned.

- All pile excavations should be observed by the Project geotechnical engineer or the owner's representatives during drilling and prior to the placement of reinforcement and concrete so that if conditions differ from those anticipated, appropriate recommendations can be made.

14.0 REPORT COPY LIST

This report will be transmitted to the prime designer, Consor, for further distribution.

15.0 INVESTIGATION LIMITATIONS

Our services consist of professional opinions and recommendations made in accordance with generally accepted geotechnical engineering principles and practices and are based on our site reconnaissance and the assumption that the subsurface conditions do not deviate from observed conditions.

All work done is in accordance with generally accepted geotechnical engineering principles and practices. No warranty, expressed or implied, of merchantability or fitness, is made or intended in connection with our work or by the furnishing of oral or written reports or findings.

The scope of our services did not include any environmental assessment or investigation for the presence or absence of hazardous or toxic materials in structures, soil, surface water, groundwater, or air, below or around this site.

Unanticipated soil conditions are commonly encountered and cannot be fully determined by taking soil samples and excavating test borings; different soil conditions may require additional expenditures be made during construction to attain a properly constructed project. Some contingency fund is thus recommended to accommodate these possible extra costs.

This report has been prepared for the proposed Project as described earlier to support the structural design of the Project elements.

In the event, any changes in the design or location of the facilities are planned, or if any variations or undesirable conditions are encountered during construction, our conclusions and recommendations shall not be considered valid unless the changes or variations are reviewed, and our recommendations modified or approved by us in writing.

This report is issued with the understanding that it is the structure designer's responsibility to ensure that the information and recommendations contained herein are incorporated into the Project and that necessary steps are also taken to see that the recommendations are carried out in the field.

The findings in this report are valid as of the present date. However, changes in the subsurface conditions can occur with the passage of time, whether they are due to natural processes or to the works of man, on this or adjacent properties. In addition, changes in applicable or appropriate standards occur, whether they result from legislation or from the broadening of

knowledge. Accordingly, the findings in this report might be invalidated, wholly or partially, by changes outside of our control.

Respectfully submitted,
PARIKH CONSULTANTS, INC.

Version 3.5 Notes:
1. The correction factors CE (Energy Ratio), CB (Borehole Diameter), CR (Rod Length) and CS (Sampling Method-liner), CN (Overburden) are per Youd 2001
2. The conversion factors from Modified California Sampler (MC)-N or California Sampler (C)-N to SPT-N are based on Caltrans Geotechnical Manual, "Soil Correlations" module (March 2021):
   MC Cohesive: 0.65 MC Cohesionless: 0.41 C Cohesive: 0.85 C Cohesionless: 0.63
3. For fine-grained materials, the correlated undrained shear strengths are based on Caltrans Geotechnical Manual, "Soil Correlations" module (March 2021).
4. The friction angles were estimated based on Caltrans Geotechnical Manual, "Soil Correlations" module (March 2021).
5. Residual Strength (Sr) is based on Kramer and Wang (2015) as suggested in the Caltrans Geotechnical Manual, "Liquefaction-Induced Lateral Spreading" module (January 2020).
6. The estimated Vs were correlated based on Caltrans Geotechnical Manual, "Design Acceleration Response Spectrum" module (January 2021).

Version 3.5 Notes:
1. The correction factors CE (Energy Ratio), CB (Borehole Diameter), CR (Rod Length) and CS (Sampling Method-liner), CN (Overburden) are per Youd 2001
2. The conversion factors from Modified California Sampler (MC)-N or California Sampler (C)-N to SPT-N are based on Caltrans Geotechnical Manual, "Soil Correlations" module (March 2021):
   MC Cohesive: 0.65 MC Cohesionless: 0.41 C Cohesive: 0.85 C Cohesionless: 0.63
3. For fine-grained materials, the correlated undrained shear strengths are based on Caltrans Geotechnical Manual, "Soil Correlations" module (March 2021).
4. The friction angles were estimated based on Caltrans Geotechnical Manual, "Soil Correlations" module (March 2021).
5. Residual Strength (Sr) is based on Kramer and Wang (2015) as suggested in the Caltrans Geotechnical Manual, "Liquefaction-Induced Lateral Spreading" module (January 2020).
6. The estimated Vs were correlated based on Caltrans Geotechnical Manual, "Design Acceleration Response Spectrum" module (January 2021).

Appendix IV-2 Liquefaction Evaluations and Soil Densification

SEISMIC-INDUCED SETTLEMENT (SOIL DENSIFICATION)

- Method by Tokimatsu and Seed (1987)

Project Name: **JACALITOS**
Project No.: **2024-102-GEO**
Boring No.: **R-24-001**

INPUT PARAMETERS

Peak Ground Accel., PGA (g)=	0.66			
Earthquake Magnitude, M =	6.45			
Water Table Depth =	100.00	(ft)	30.48	(m)
Average γ above water table =	120.0	(pcf)	18.9	(kN/m^3)
Average γ below water table =	62.6	(pcf)	9.8	(kN/m^3)
Borehole diameter (mm) =	2.5	(in)	63.5	(mm)
Hammer Energy (%) =	82			

EQUATIONS

$G_{max} = 20{,}000(N_1)_{60}{}^{0.333}(\sigma'_{ol})^{0.50}$ where $\sigma'_m = 0.67 \times \sigma'_{vc}$

$\gamma_{eff} \times (G_{eff}/G_{max}) = 0.65_{rd}(\sigma_{vo}/G_{max})\,(a_{max}/g)$ where $r_d = 1 - 0.012z$ (z = depth in meters)

Volumetric Strain Ratio = 1

Settlement = volumetric strain x layer thickness

Approximate Total Settlement of Dry Sand = 0.1 in

SEISMIC-INDUCED SETTLEMENT (SOIL DENSIFICATION)

- Method by Tokimatsu and Seed (1987)

Project Name **JACALITOS**
Project No. **2024-102-GEO**
Boring No. **A-16-003**

INPUT PARAMETERS

Peak Ground Accel., PGA (g)=	0.66			
Earthquake Magnitude, M =	6.45			
Water Table Depth =	100.00	(ft)	30.48	(m)
Average γ above water table =	120.0	(pcf)	18.9	(kN/m^3)
Average γ below water table =	62.6	(pcf)	9.8	(kN/m^3)
Borehole diameter (mm) =	2.5	(in)	63.5	(mm)
Hammer Energy (%) =	87			

EQUATIONS

$G_{max} = 20{,}000(N_1)_{60}{}^{0.333}(\sigma'_{ol})^{0.50}$ where $\sigma'_m = 0.67 \times \sigma'_{vc}$

$\gamma_{eff} \times (G_{eff}/G_{max}) = 0.65_{ol}(\sigma_{vo}/G_{max})\,(a_{max}/g)$ where $rd = 1 - 0.012z$ (z = depth in meters)

Volumetric Strain Ratio = 1

Settlement = volumetric strain x layer thickness

Approximate Total Settlement of Dry Sand = 0.1 in

Foundation Design Recommendations (after MTD 3-1, Attachment 1, Table 3-6)

Location	Pile Type	Cut-off Elevation (ft)	Service-I Limit State (kips) per support		Total Permissible Support Settlement (in)	Required Nominal Resistance (kips)				Design Tip Elev. (ft)	Specified Tip Elevation (ft)
						Strength Limit		Extreme Event			
			Total	Permanent		Comp. (qs=0.7) (qp=0.7)	Tension (qs=0.7)	Comp. (qs=1.0)	Tension (qs=1.0)		
Abut 1	30" dia. CIDH	649.25	1,510	1,250	1	360	-	150	-	607 (a-I) 629 (a-II) 630 (c)	605
Bent 2	36" dia. CIDH	652	1,110	730	1	1,350	-	730	-	585 (a-I) 609 (a-II) 610 (c)	583
Bent 3	36" dia. CIDH	652	1,110	730	1	1,350	-	730	-	585 (a-I) 609 (a-II) 610 (c)	583
Abut 4	30" dia. CIDH	649.25	1,510	1,280	1	400	-	150	-	605 (a-I) 629 (a-II) 630 (c)	603

Notes:
(1) Design tip elevations are controlled by (a-I) Compression (Strength Limit), (b-I) Tension (Strength Limit), (c) Settlement
(2) The specified tip elevations shall not be raised above the design tip elevations for Tension, Settlement, and Lateral Load.
(3) Slurry displacement method may be used for concrete placement of the CIDH piles. Therefore, the specified pile tip elevations are two feet below the design tip elevations to account for the zone of untested concrete due to the limitations of the gamma-gamma logging (GGL) equipment (Caltrans Geotechnical Manual, "CIDH Concrete Pile Design Considerations" Module, dated March 2021.

Pile Data Table

Location	Design Method	Pile Type	Nominal Resistance (kips)		Design Tip Elev. (ft)	Specified Tip Elevation (ft)
			Compression	Tension		
Abut 1	LRFD	30" dia. CIDH	360	-	607 (a); 630 (c)	605.0
Bent 2	LRFD	36" dia. CIDH	1,350	-	585 (a); 610 (c)	583.0
Bent 3	LRFD	36" dia. CIDH	1,350	-	585 (a); 610 (c)	583.0
Abut 4	LRFD	30" dia. CIDH	400	-	605 (a); 630 (c)	603.0

Notes:
(1) Design tip elevations are controlled by: (a) Compression, (c) Settlement
(2) The specified tip elevations shall not be raised above the design tip elevations for Tension, Settlement, and Lateral Load.
(3) Slurry displacement method may be used for concrete placement of the CIDH piles. Therefore, the specified pile tip elevations are two feet below the design tip elevations to account for the zone of untested concrete due to the limitations of the gamma-gamma logging (GGL) equipment (Caltrans Geotechnical Manual, "CIDH Concrete Pile Design Considerations" Module, dated March 2021.

Federal Project No. BRLO-033(082)
WRECO Project No. 15033

WRECO is pleased to submit our Draft Foundation Report for the Jacalitos Creek Bridge Replacement Project on Lost Hills Road. This report was conducted and prepared in general conformance with the scope of work prepared by WRECO for the subject project.

We would like to thank T.Y. Lin International Group and Fresno County for the opportunity to prepare this draft foundation report.

If you have any questions or wish to discuss this report in greater detail, please contact us at (916) 757-6150.

Sincerely,
WRECO

DRAFT FOUNDATION REPORT
JACALITOS CREEK BRIDGE REPLACEMENT PROJECT
FRESNO COUNTY

1 INTRODUCTION

The purpose of the Jacalitos Creek Bridge Replacement Project on Lost Hills Road is to replace the structurally deficient existing Jacalitos Creek Bridge in Fresno County, California. This Bridge Replacement project is funded by the Federal Highway Bridge Program (HBP).

1.1 Scope of Work

WRECO's Scope of Work for the proposed Jacalitos Creek Bridge Replacement Project on Lost Hills Road Draft Foundations Report consisted of the following:

- Visited the site and marked out in white paint the proposed boring locations and called USA North Dig Alert a minimum of 72-hours prior to the start of the field investigation work to identify potential underground utility conflicts.
- Paid all fees and obtain a well construction/destruction (boring) permit from the Fresno County Department of Environmental Health to perform borings at the project site.
- Obtained an encroachment permit to perform work within the County's right-of-way (at no cost). Obtained (by others) permission to enter the property adjacent to the Project to perform the soil boring work with minimal traffic control.
- Performed a literature search for readily available published geologic and geohazards information at and in the near vicinity of the project site.
- Obtained copies of readily available previous studies performed at or in the near vicinity of the project site.
- Obtained available copies of the as-built bridge plans for the subject bridge.
- Performed a field investigation to better characterize the subsurface conditions at the proposed bridge site. As part of the field investigation program, the following was performed:
    - Drilled four (4) soil borings to completion depths 50.8 to 51.5 feet below existing road grade. These borings were located adjacent to the existing bridge and road alignment. The drilling was used to obtain disturbed and relatively undisturbed representative soil samples for use in better characterizing the soil conditions at the proposed foundation locations. A WRECO technician was onsite during drilling and logged the recovered soil samples as drilling progressed. The soils and rock will be classified using the *2010 Caltrans Soil and Rock Logging, Classification, and Presentation Manual*.

  - The borings were backfilled with lean cement grout in accordance with the State Water Quality Control Board requirements. Drill cuttings were drummed and disposed of offsite.
  - Tested representative soil samples in a laboratory to better determine their engineering parameters. Laboratory testing consisted of moisture/density testing, gradation determination, corrosive potential, and R-value testing.

- Prepared a Draft Bridge Foundation Report in general accordance with the Caltrans *Foundation Report Preparation for Bridge Foundations, December 2009*. This report provides the following information:
  - A description of the geotechnical work performed.
  - A project summary and description of the proposed improvements.
  - An overview of the field investigation and laboratory testing performed as part of this study.
  - A discussion of the regional and site geology as it pertains to the proposed improvements.
  - A summary of the identified site soils, summary of the laboratory testing results and a Log of Test Borings (LOTB) for the borings drilled.
  - A discussion of the regional seismology and assumed preliminary seismic design parameters for the proposed Project site in accordance with the Caltrans *2009 ARS Online Design Tool and the Caltrans Seismic Design Criteria, Version 1.7, November 2013*.
  - A liquefaction evaluation of the identified soils based on the site-soils encountered.
  - A summary and discussion of the available as-built information as it pertains to the proposed foundation selection.
  - A discussion of the results of the grain-size determination of the site soils for use in determining predicted scour at the site based upon the proposed bridge configurations and its potential impacts on the proposed foundations.
  - A slope stability analysis for the completely saturated case when the canal is full flowing and the seismic case when the water is at the annual mean elevation.
  - A discussion of the preliminary foundation recommendations for the proposed bridges taking into account the preliminary loading demands, site soil and rock conditions, environmental constraints, scour, and cost.
  - Approach grading recommendations to aid in the temporary construction staging and any profile correction work.
  - New flexible structural pavement section recommendations for the reconstructed roadway and approaches.

- A discussion of the additional field work and laboratory testing, if any, which would be required for final design.
- Contract Standard Special Provisions (SSP) language for inclusion in the Contract Documents to better identify and quantify the foundation construction risk during bidding.

2 PROJECT DESCRIPTION

Jacalitos Creek Bridge on Lost Hills Road serves as an overcrossing for Jacalitos Creek, a dry wash, which flows from west to east underneath the existing bridge. The subject Bridge Replacement Project includes the replacement of the existing structurally deficient bridge and reconstruction of the bridge approaches, scour protection within the wash and improvements to Lost Hills Road. The proposed bridge replacement is required to improve public safety.

2.1 Project Location

The project site is located in Fresno County, California on Lost Hills Road immediately west and north of the intersection with Jacalitos Creek Road, approximately 1.7 mile west of California State Route 33. The project is located were Jacalitos Creek flows out of the Jacalitos Hills and Kreyenhagen Hills into the gently sloping floor of Pleasant Valley. The land adjacent to the project is generally open rural area which can be seen on Figure 1, Vicinity Map, included in Appendix I of this report. The approximate center of the project area is at Latitude 36.10198055 East and Longitude 120.31078577 West.

2.2 Existing and Proposed Bridges

The existing Jacalitos Creek Bridge is a five span, approximately 115-foot long, 28.6-foot wide, (with two 13-foot wide lanes) bridge which was lengthened in 1970. The existing structure consists of two structure types with the original three spans of simply supported untreated Douglas Fir Stringers with a cast-in-place concrete deck on reinforced concrete five column bent type piers and reinforced concrete strutted abutment. The remaining two spans consist of a continuous cast-in-place flat slab deck supported on reinforced concrete three column pile extension bents with a reinforced concrete diaphragm abutment. Bridge supports include driven steel H-piles at Abutment 1, driven concrete piles at Bents 2 and 3, and spread footings at Bents 4, 5, and 6.

According to the information provided by T.Y. Lin International Group (TYL), the new Jacalitos Creek Bridge is proposed to be a three span bridge on approximately the existing alignment of either 105 ft (Alternative 1) or 140 ft (Alternative 2) length. The location of the bridge is shown in relation to the existing features in Figure 2 of Appendix I.

The approximate surface elevations shown on the site plans provided by TYL were used to reference elevations in this draft foundation report.

3 EXCEPTIONS TO POLICY

No exceptions to policy were taken in preparation of this draft foundation report.

4 FIELD INVESTIGATION AND TESTING PROGRAM

The subsurface conditions in the vicinity of the proposed bridge abutments were characterized by means of four borings (A-16-001B to A-16-004) of 50.8 to 51.5 foot depth. Boring A-16-001A was completed to a depth of 12.0 feet below existing grade before auger refusal. This boring was backfilled with neat cement grout then relocated 2 feet to the east. Boring A-16-001B was then completed to a depth of 50.8 feet. The borings are located along the existing road alignment, adjacent to the existing abutments, and one boring (A-16-003) was located within the dry wash of Jacalitos Creek. The borings were drilled by Taber Drilling on October 22-23, 2016 with a CME-55 track-mounted drill rig while complying with permits received from Fresno County.

The boreholes were advanced by utilizing hollow stem auger (HSA) drilling methods, with 8-inch augers. The soil samplers' were advanced/driven using a 140-pound auto-trip hammer, free falling 30-inches, in general conformance with conducting the California Modified Sampler (ASTM D-3550) and the Standard Penetration Test (ASTM D1586). Relatively undisturbed soil samples of the subsurface materials were obtained using a California Modified Sampler (Cal-Mod) fitted with three 6-inch brass or stainless steel sleeve liners. Disturbed subsurface samples were obtained from the boreholes at selected intervals using a Standard Penetration Test (SPT) Sampler without liners. The field blow counts were recorded as the number of hammer blows required to drive the sampler the final 12-inches of an 18-inch drive. The uncorrected field blow counts are shown on the LOTB drawing. A bulk sample of the channel materials below the existing bridge deck was collected during WRECO's preliminary site visit on April 30, 2015.

The recovered soils samples were logged by an on-site WRECO technician as drilling progressed using the procedures in the *2010 Caltrans Soil and Rock Logging, Classification, and Presentation Manual*.

A summary table of the boring locations, ground surface elevations, drilled depths, and hammer efficiency ratios are provided in the following table.

Table 1. Summary of Boring Locations

Boring ID	Alignment	Approximate Stationing, offset (feet)	Approximate Surface Elevation (feet)	Drilled Depth (feet)	Groundwater Elevation during Drilling (feet)	Equipment/Exploration method/Hammer Efficiency Ratio
A-16-001A	Lost Hills Road Centerline	STA. 11+85, 15' Lt	669.5	12.0	--	CME-55/HSA/87%
A-16-001B	Lost Hills Road Centerline	STA. 11+75, 15' Lt	669.5	51.5	--	CME-55/HSA/87%
A-16-002	Lost Hills Road Centerline	STA. 10+85, 15' Lt	669.5	51.5	--	CME-55/HSA/87%
A-16-003	Lost Hills Road Centerline	STA. 9+75, 20' Rt	660	50.8	--	CME-55/HSA/87%
A-16-004	Lost Hills Road Centerline	STA. 9+20 30' Lt	670	50.5	--	CME-55/HSA/87%

Note:
1. Field testing consisted of performing the Standard Penetration Test (ASTM D1586) and Modified California (ASTM D-3550) sampling at 5 foot intervals up to maximum explored depth.
2. Groundwater was not identified in the borings either during or immediately after drilling was completed.

The borings were located in the field with respect to existing site features and then referenced to project stationing. The boring elevations are referenced to project datum provided by TYL. Detailed soil descriptions, unit breaks and boring information is presented on the LOTB in Appendix II. Raymond Downes was the field technician for this study.

5 LABORATORY TESTING PROGRAM

Laboratory soil testing for this study consisted of grain size determination, plasticity, corrosive potential (i.e. sulfate content, pH, resistivity, and chloride content testing), moisture content, and R-value testing. A summary of the laboratory testing is provided in Table 2.

Table 2. Laboratory Test Summary

Boring ID	Sampled Interval (feet)	Test	Standard (ASTM/CTM)
A-16-001A	0.0 - 5.0	R-value	CTM 301
	10.0 – 11.5	Atterberg Limits, Grain Size	ASTM D4318, ASTM D422
A-16-001B	25.0 – 26.5	Grain Size, Moisture Content	ASTM D422, D2216
	30.0 – 31.5	Grain Size	ASTM D422
	50.0 – 51.5	Grain Size	ASTM D422
A-16-002	10.0 – 11.5	Atterberg Limits, Grain Size	ASTM D4318, ASTM D422
	20.0 – 21.5	Grain Size	ASTM D422
	40.0 – 41.5	Atterberg Limits, Grain Size	ASTM D4318, ASTM D422
A-16-003	5.0 – 6.5	Atterberg Limits	ASTM D4318
	25.0 – 26.5	Atterberg Limits	ASTM D4318
	30.0 – 31.5	Corrosive Potential	CTM 643, CTM 417, CTM 422
A-16-004	5.0 – 6.5	Atterberg Limits, Moisture Content	ASTM D4318, ASTM D2216

Notes:
ASTM: American Society for Testing and Materials
CTM: California Test Methods

The samples tested are shown on the LOTB which is included in Appendix II. Copies of the laboratory test results can be found in Appendix IV. Results of the corrosive potential to buried steel and concrete testing are further discussed in Section 8 of this report.

6 SITE GEOLOGY AND SUBSURFACE CONDITIONS

6.1 Geology

The project site is just south of Coalinga in an unincorporated portion of western Fresno County, California. Physiographically, the subject site is located at the western edge of the Great Valley Geomorphic Province and borders the Coast Ranges Geomorphic Province located immediately to the west of the site. The province encompasses the San Joaquin and Sacramento valleys' and is bounded by the Sierra Nevada Mountains to the east, the Coast Ranges to the west, the Transverse Range (Tehachapi Mountains) to the south, and the Klamath Mountains to the north.

The San Joaquin Valley is a structural trough that covers 2,374 square miles, which makes up the southern two-thirds of the Great Valley Geomorphic Province. The San Joaquin Valley extends from the Stockton-Tracy area on the north to the Transverse Ranges on the south. The southern San Joaquin Valley basin is bounded by the Temblor Ranges on the west, the Sierra Nevada Mountains on the east, and the San Emigdio and Tehachapi mountains to the south. The west side of the basin consists of a tightly folded anticlinorium, which is sub-parallel to the San Andreas Fault. The east side of the valley is a broad homocline. The valley surface is relatively flat and is underlain by thousands of feet of alluvial (river), lacustrine (lake), and marine (ocean) deposits that have accumulated in an elongate, asymmetrical sedimentary basin to form the structural trough as the adjacent mountain ranges elevated. The main axis of the San Joaquin basin is north-northwestern trending along the valley's main drainage axis.

During the late Mesozoic and to the early and middle Cenozoic eras (approximately 20 to 100 million years before present), deposition of thousands of feet of marine sediments occurred within the Great Valley. Continental deposits (generally alluvium) of late Tertiary and Quaternary age (approximately 20 million years ago to present) overlie these marine sediments. A total of 32,000 feet of continental deposits and underlying marine sediments were deposited into the San Joaquin Valley trough (or subbasin) during periodic inundation by the Pacific Ocean and by erosion of the surrounding mountains.

Based on the Geologic Map of the Kreyenhagen Hills Quadrangle (Dibbley and Minch, 2006), the Project site is underlain by Quaternary Age Surficial Sediments (Qa). The Surficial Sediments are described as "alluvial gravel, sand and clay of valley areas; includes gravel and and of stream channels" (Dibblee and Minch, 2006). Quaternary Age Older Surficial Sediments (Qoa) border the project site along the edges of the Jacalitos Creek valley to the southeast and are described as "alluvial gravel, sand and clay of dissected terraces." The hills adjacent to Jacalitos Creek valley are mapped as underlain by older formational materials. Quaternary age Tulare Formation (QTt) is mapped approximately 0.25 miles to the northwest and southeast of the site and is described as "pebble gravel/conglomerate, sand and clay." Pliocene to uppermost Miocene age Etchegoin Formation (Te) is mapped approximately 0.25 miles west of the project site and is described as sandstone.

The project site can be seen in relation to the published geology on Figure 2, Geologic Map that is included in Appendix I.

6.2 Subsurface Conditions

The earth materials encountered in the borings are considered consistent with the published geologic mapping. Two units were identified in the borings that are considered significant to the proposed project (summarized below). The LOTB drawing provides more specific soil descriptions, layer breaks, and boring details.

The borings performed at the project site are in general agreement with the published literature, closely resembling that of the mapped units at and adjacent to the site. It appears that there is some locally derived fill material behind the approaches which appear to be placed directly on native soils. The major strata identified primarily consists of dense to very dense interbedded silty and clayey sands with lesser amounts of silt and lean clay to full depth explored (lowest elevation 609.5). Poorly-graded sand and well-graded gravel were found in the upper 14 ft of the soil column in boring A-16-003, which likely represents recent channel bedload.

For the boring locations and the actual descriptions of the soils encountered, as well as an illustration of the soil strata breaks refer to the LOTB attched to this report in Appendix II.

6.3 Groundwater

No groundwater was encountered in the borings conducted for this investigation. The nearest location monitored by the California Department of Water Resources is located approximately 0.75 miles to the northeast (indicates groundwater depth generally remains below 354 ft below

ground surface. No water was observed in the channel, notable as rain had fallen within the watershed several days before the site investigation.

For design purposes, the groundwater elevation was set at an elevation of 609.5 feet, 51.5 feet below existing ground surface, which is the deepest elevation explored during subsurface exploration completed for this study.

7 SCOUR EVALUATION

The site has a history of scour damage, most notably the partial collapse of the original structure in 1958 after a high flow event in March and early April of that year. Damage was recorded at one of the overflow bridge structures in 1969. The subject bridge location was damaged again in 1983 when the approach embankment leading to Abutment 6 was washed out and scour exposed two steel piles. Channel protection measures including gabions and slope paving have also been noted to have been damaged or undermined. Channel sections reported in available Bridge Inspection Reports prepared by Caltrans indicate little change in the average channel bottom elevation with approximately 3 ft of maximum vertical change between 1978 and 2005. The portions of the channel near Abutment 1 to Bent 3 generally increased in elevation while the portion of the channel near existing Bents 4 and 5 have lowered in elevation during that time. The Final Hydraulic Report (Caltrans, 2013) indicates the potential for up to four feet of long-term degradation during the life of a replacement bridge.

A bulk sample of the channel bedload was obtained during the field investigation and a grain size determination was made in the laboratory. This sample consisted of poorly graded sand with gravel (SP) and are therefore considered prone to scour. The underlying soils as observed in the borings consist of silty and clayey sands and are therefore also considered prone to scour.

Based on the above, the channel appears susceptible to scour, but long term trends do not indicate appreciable changes in average channel elevation. For this draft report it is therefore assumed that long term scour will result in up to 5 ft of channel degradation (approximate elevation 665). The recommendations of this draft report should be reviewed once a design scour depth is determined.

8 CORROSION EVALUATION

The Caltrans has the following definition of corrosive soils:

"For structural elements, the Department considers a site to be corrosive if one or more of the following conditions exists for the representative soil and/or water samples taken at the site:

- *Chloride concentration is 500 ppm or greater,*
- *Sulfate Concentration is 2000 ppm or greater,*
- *pH is 5.5 or less."*

In addition to the conditions listed above, The California Amendments to AASHTO LRFD Bridge Design Specifications, 6th Edition Section 10.7.5 considers a site corrosive if the additional condition listed below exists for the representative soil and/or water samples taken at the site:

- Minimum resistivity of 1000 ohm-cm or less

WRECO performed corrosive potential testing for this study on one recovered representative soil samples. The results are presented in Table 3 below:

Table 3. Soil Corrosion Data

Location	Depth (feet)	Minimum Resistivity (ohm-cm)	Soil pH	Chloride Content (ppm)	Sulfate Content (ppm)
A-15-003	30.0 – 31.5	3,480	8.50	3.4	18.6

Based on the corrosive potential testing results the site soils are considered non-corrosive to buried metal and concrete as defined by Caltrans Corrosion Guidelines.

Even though the site was determined to be non-corrosive in nature, the following mitigation measures may be employed as prudent engineering practice but are not required. For concrete, the use of mineral admixtures (such as fly ash, silica fume, metakolin, etc.), along with reduced water content, and increased cementitious material content, generally result in a high-density durable concrete that is more resistant to corrosion. According to the California Amendments to the Load and Resistance Factor Design (LRFD) Bridge Design Specifications Fourth Edition *Table 5.12.3-1 Minimum Concrete Cover (inches) for 75 year Design Life*, the maximum water-to-cementitious material ratio shall not exceed 0.40, and a minimum of 3 inches of clear cover shall be provided for all reinforcing bars where the concrete is cast against the surrounding soils. We also recommend the use of a minimum of 675 pounds per cubic yard of cementitious material, and Type II Modified or Type V cement with 25 percent mineral admixtures be used on all locations where the concrete is to remain in permanent contact with the surrounding soils. Using *Figure 854.3B, "Minimum Thickness of Metal Pipe for 50 Years of Maintenance Free Service Life"* from the Caltrans Highway Design Manual, the minimum corrugated metal pipe thickness should be 16-gauge and should be constructed of galvanized steel. This minimum thickness is based upon corrosion assessment only and the pipe section should be checked structurally to determine the minimum thickness based upon the proposed loading requirements. For additional guidance to help mitigate the corrosion of reinforced concrete due to chlorides, sulfates, and acids, refer to the Caltrans Bridge Memo to Designers 10-5.

9 SEISMIC RECOMMENDATIONS

9.1 Potential Seismic Hazards

The project is located in a low to moderately seismically active area of California. Potential geologic and potential seismic hazards for the site include seismic shaking (ground motion), subsidence, and seismically induced settlement.

9.2 Ground Surface Rupture

The project site does not lie within or adjacent to an Alquist-Priolo Earthquake Fault Zone. Active faulting has not been mapped as occurring across or adjacent to the project site. The closest active fault is the Great Valley 13 (Coalinga) Fault (Fault ID No.205), which is located at a distance of about 8 miles northeast of the project site. Surface rupture due to faulting within the project site is not anticipated expected to occur unless an unknown or previously unmapped fault were to rupture within the project limits.

9.3 Ground Motion

A seismic study was performed to develop seismic design parameters for the proposed bridge design. Following the Caltrans Seismic Design Criteria (SDC) Version 1.7, (Caltrans, 2013), Memos to Designer (MTD) Section 20, and design tools outlined in the Caltrans *Methodology for Developing Design Response Spectrum for Use in Seismic Design Recommendation, November 2012*, a seismic analysis was performed for this structure to develop seismic design parameters and to identify potential seismic hazards such as liquefaction or lateral spreading. Both the deterministic and probabilistic (5% probability of exceedance in 50 years [975 year average return period]) methodologies were evaluated for use in developing the site seismic design parameters. The site is not located in a deep sedimentary basin, and no basin amplification was necessary. Based on the deterministic analysis, the controlling faults of the project site are the Great Valley 13 (Coalinga) Fault (Fault ID No.205) in the short period, and the San Andreas (Creeping Section) Fault (Fault ID No. 182) in the long period. The fault data is listed below:

Table 4. Fault Data

Fault Name	Great Valley 13 (Coalinga) Fault	San Andreas (Creeping Section) 2011 CFM Fault	Great Valley 14 (Kettleman Hills) Fault
Fault Identification Number (FID)	205	182	210
Fault Rupture Distance from site (R_{RUP})	8 miles (13 kilometers)	15 miles (24 kilometers)	10 miles (16 kilometers)
Fault Rupture Direction from site	Northeast	Southwest	East
Maximum Moment Magnitude (M_{max})	7.0	7.9	7.1
Fault Type	Reverse	Right-lateral strike-slip	Reverse
Dip Angle (degree)	15	90	22
Dip Direction	West	Vertical	West

The site average shear wave velocity (Vs_{30}) is conservatively estimated to be 283 meters per second (m/s) based on the logged soils and site specific Standard Penetration Test (SPT) blow counts presented in the LOTB.

The PGA for the site is estimated at 0.59g ("g" is the acceleration due to gravity). The associated peak spectral acceleration at the site is estimated at about 1.29g at an approximately 0.25 second period. The seismic results should be considered a good estimate but may be subject to change

based on additional site-specific shear wave velocity data obtained during later design stages. The design response spectrum (i.e. ARS curve) is the result of the Probabilistic Response Spectrum.

Table 5. Seismic Analyses Site Data

Site Location: Centroid of the Jacalitos Creek Bridge	Latitude: 36.10198055
	Longitude: -120.31078577
Controlling Fault	Great Valley 13 (Coalinga)
Style of Fault	Reverse
Approximate Distance from Fault to Site	8.1 mi. (13.0 km)
Maximum Credible Earthquake Magnitude	7.0
Estimated Site Shear Wave Velocity (Vs_{30})	283 meters/ second
Peak Ground Acceleration (PGA)	0.59 g

The project site is shown in relation to the Great Valley 13 (Coalinga), Great Valley 14 (Kettleman Hills), and the San Andreas Fault on Figure 3 - Late Quaternary Fault Map, and the ARS curve is presented as Figure 4, located in Appendix I. The seismic analysis is located in Appendix V.1.

9.4 Other Seismic Hazards

The site has no known history of subsidence, rock falls/landslides, or embankment failures due to seismic activity and none were observed during our limited field observations and our review of available published seismic hazards for the project area.
The site has no known history of rock falls/landslides, embankment failures, tsunami, slope instability due to seismic activity and none were observed during our limited field observations and our review of available published seismic hazards for the project area.

9.4.1 Rockfalls / Landslides

The site is generally flat, therefore rockfalls and landslides do not appear to be an issue within the project limits.

9.4.2 Embankment Failures

Our limited site review did not identify any features consistent with embankment failures.

9.4.3 Tsunami / Seiche

The site is located inland approximately 60 miles away from the nearest coast, therefore tsunamis do not appear to be a hazard within the project limits.

9.4.4 Seismically Induced Slope Instability

Our limited site review did not identify any features consistent with seismically induced slope instability. The site is generally level therefore seismically induced slope instability does not appear to be an issue within the project limits.

9.5 Liquefaction Evaluation

Liquefaction is the process in which the seismic shear waves cause an increase in the pore water pressure in a cohesionless (sand and some non-cohesive silts) soil strata. This increase in pore water pressure reduces the effective stress confining the soil. The reduction in effective stress causes a reduction in the shear modulus of the soil, which in turn, results in increased soil deformation. Also associated with liquefaction is a loss in bearing strength. In the case of full liquefaction, when the increase in pore water pressure reduces the confining stress to zero, the soil experiences a full loss of strength and undergoes large viscous deformations. Lateral spreading (large lateral deformations) are possible when liquefaction occurs in ground having even minimal slope. Cohesionless soils which are in a loose to medium dense state when subjected to seismic shear waves compact in place, similar to being compacted with a vibratory roller. The energy of the seismic event reorganizes the grains to a more dense state and subsequently causes a reduction in the overall volume resulting in a settlement of the soils. Primary factors that can trigger liquefaction are moderate to strong ground shaking, relative clean and loose granular soils, and saturated soil conditions. Liquefaction is generally limited to the upper 50 feet of ground surface due to the increasing overburden pressure with depth.

The liquefaction evaluation was performed for the proposed structure using the subsurface soil and groundwater conditions discussed in Sections 6.2 and 6.3. As discussed previously, the project site is generally underlain by silty sand and silt and no groundwater was encountered during the subsurface investigation. Regionally, groundwater is typically deeper than 350 feet below ground surface, therefore the upper 350 feet of material may only be saturated during rain events. Due to the general lack of groundwater within the upper 50 ft of the site the liquefaction potential was determined to be negligible at the project site under the extreme seismic event discussed in section 9.4.

A dry dynamic settlement analysis was performed to better quantify the potential of settlement of the unsaturated granular soils. The results of the dry dynamic settlement analysis indicates the site soils will settle up to approximately 0.25 inches when subjected to the design earthquake event. Copies of the dry dynamic settlement are included in Appendix V.2.

10 AS-BUILT FOUNDATION DATA

The available Bridge Inspection Reports and as-builts for the existing Jacalitos Creek Bridge on Lost Hills Road were reviewed as part of this study. The existing bridge is a five span structure consisting of two structure types. The original three spans consist of simply supported untreated Douglas Fir stringers with a cast in place reinforced concrete deck supported by reinforced concrete five-column bents and a reinforced concrete strutted abutment. The bridge was lengthened by means of an additional two span cast-in-place reinforced concrete flat slab deck supported on reinforced three-column pile extension bents with a reinforced concrete diaphragm

abutment. Abutment 1 is founded on driven steel H-section piles, Bent 2 and 3 on precast-prestressed concrete piles, Bents 4 and 5 on spread footings, and Abutment 6 on spread footings.

Support	Foundation Type	Bottom of Footing Elev. (feet)	Min Pile Tip Elev. (feet)
Abutment 1	Spread Footing	660 (estimate)	
Bent 2	Spread Footing	660 (estimate)	
Bent 3	Spread Footing	660 (estimate)	
Bent 4	10x84 HS Pile		634.00 (estimate)
Bent 5	10x84 HS Pile		633.70
Abutment 6	10x84 HS Pile		639.59

Note: Abutment 1, and Bents 2 through 3 footing elevations not provided on as-built plans. Bent 4 elevations are blurred on available as-built drawing and minimum embedment value is assumed.

From our geotechnical soil exploration, it appears that all current substructure foundations are bearing directly on the native dense silty to clayey sands.

Copies of the available plans of the existing bridge are attached to this report in Appendix II.

11 FOUNDATION RECOMMENDATIONS

The soils encountered in the four soils borings performed within the proposed structure limits dictate that the proposed substructures should be supported on deep foundations. The site-specific field investigation generally encountered medium dense to very dense silty sand (SM) to clayey sand (SC) with layers of gravel (GW-GM) and clay (CL). Typically in these types of soils cast in drilled hole (CIDH) piles are the most cost effective pile type. Heavy section driven steel piles are an acceptable alternative, but difficult driving conditions are likely. Based upon discussions with TYL, the preferred pile type is Cast-In-Drilled-Hole (CIDH) piling.

Foundation design recommendations for the Jacalitos Creek Bridge were determined using the 2012 AASHTO LRFD Bridge Design Specification (BDS) with Caltrans Amendments as required by the current Caltrans design policy. The recommendations are presented in the following discussions.

11.1 Foundation Data and Loading

Based upon the information provided by T.Y. Lin and the previous phase work, all supports will be supported on deep foundations. Foundation data and loading were provided by T.Y. Lin electronically on May 10, 2016 and are reproduced in Tables 6, 7, 8, and 9. Two alternative bridge designs are being considered at this time, and the analysis for each is presented in Sections 11.2.1 and 11.2.2.

11.2 Deep Foundations

11.2.1 Alternative 1

Full pile capacity analyses were performed for two alternative designs proposed by T.Y. Lin. Design Alternative 2 represents a larger structure, with longer spans between the abutments and bents, than Design Alternative 1.

The CIDH axial pile capacity analyses were performed using the pile analysis software, SHAFT 2012 by Ensoft, Inc., following the Federal Highway Administration (FHWA) Drilled Shafts Construction Procedures and LRFD Design Methods Manual. The design groundwater elevation for the static design capacity was set at the historic groundwater depth of Elevation 354 feet, as stated in Section 6.3.

The following table provides the required pile loadings and specified tip elevations for service limit, strength limit, and extreme event states:

Table 10. Foundation Design Recommendations – Alternative 1

Location	Pile Type	Cutoff Elevation (ft)	Service-I Limit State Load per Support (kips)		Total Permissible Support Settlement (inches)	Required Factored Nominal Resistance (kips)				Design Tip Elevation (ft)	Specified Tip Elevation (ft)
						Strength/Construction		Extreme Event			
			Total	Permanent		Comp. (φ=0.70)	Tension (φ=0.70)	Comp. (φ=1.0)	Tension (φ=1.0)		
Abutment 1	24" Diameter CIDH Pile	654.75	195	N/A	1	187	N/A	--	--	613.75 (a-I) 647.75 (c) 624.75 (d)	613.75
Bent 2	72" Diameter CIDH Pile	656	612	N/A	1	757	N/A	706	-220	614 (a-I) 619 (a-II) 637 (b-II) 637 (c) 586 (d)	586
Bent 3	72" Diameter CIDH Pile	656	609	N/A	1	756	N/A	696	-220	614 (a-I) 619 (a-II) 637 (b-II) 637 (c) 586 (d)	586
Abutment 4	24" Diameter CIDH Pile	654.75	197	N/A	1	194	N/A	--	--	613.75 (a-I), 647.75 (c) 624.75 (d)	613.75

Notes:
1. Design tip elevations are controlled by (a-I) Compression (Strength Limit), (b-I) Tension (Strength Limit), (a-II) Compression (Extreme Event), (b-II) Tension (Extreme Event) (c) Settlement, (d) Lateral Load.
2. The CIDH Specified Tip Elevation shall not be raised.

The CIDH pile lateral capacity analysis was performed using Ensoft's computer program LPile version 2013.7.07 to predict how the foundation soils at the bridge site deform and deflect in response to lateral load. The soil is modeled using lateral load-transfer and deformation curves (p-y curves) for the proposed project site.

The following table provide the lateral forces required to induce ¼-inch, ½-inch, ¾-inch and 1-inch of lateral movement at the pile head as well as the depth to and magnitude of the maximum bending moment.

Table 11. Free Head Lateral Pile Data Table for Alternative 1

Abut 1		**Lateral Load at Pile Head Deflection (kips)**			
		0.25 in	0.5 in	0.75 in	1 in
Free Head	Lateral Load (kips)	30	40	47	54
	Maximum Bending Moment (kips-in)	1400	2000	2400	2700
	Depth to Maximum Bending Moment from Pile Head (feet)	6	6	6	6
Bent 2		**Lateral Load at Pile Head Deflection (kips)**			
		0.25 in	0.5 in	0.75 in	1 in
Free Head	Lateral Load (kips)	254	365	456	527
	Maximum Bending Moment (kips-in)	23100	33900	44000	52900
	Depth to Maximum Bending Moment from Pile Head (feet)	13	12	12	13
Bent 3		**Lateral Load at Pile Head Deflection (kips)**			
		0.25 in	0.5 in	0.75 in	1 in
Free Head	Lateral Load (kips)	254	365	456	527
	Maximum Bending Moment (kips-in)	23100	33900	44000	52900
	Depth to Maximum Bending Moment from Pile Head (feet)	13	12	12	13
Abut 4		**Lateral Load at Pile Head Deflection (kips)**			
		0.25 in	0.5 in	0.75 in	1 in
Free Head	Lateral Load (kips)	30	40	47	54
	Maximum Bending Moment (kips-in)	1400	2000	2400	2700
	Depth to Maximum Bending Moment from Pile Head (feet)	6	6	6	6

Notes:
1. The maximum bending moments is based off of the governing maximum bending moment pertaining to the leading row.
2. Free head loading condition was used to calculate the lateral capacities.

The lateral resistance values published in Table 11 should only be applied to the leading edge pile in a footing, where the piles are spaced a minimum of five pile diameters (5D) perpendicular to the direction of the loading at the abutments. A reduction value for all trailing piles has been determined from the P-Multiplier Coefficients, P_m, from LRFD Caltrans Amendments Section 10.7.2.4 for determination of the total resistance of the piled footing. The reduction factors for longitudinal and transverse loading are included in Table 12. Copies of the lateral pile analyses, which include sample calculations and a schematic of the load orientation, are included in Appendix V.3 of this report.

Table 12. Calculated P-Multipliers for Alternative 1

Support Location	Pile Type/Size	Transverse Pile Spacing	Group Reduction Factor Transverse Loading	Longitudinal Pile Spacing	Group Reduction Factor Longitudinal Loading
Abut 1	24" CIDH	3.75B	0.55	3.00B	0.63
Bent 2	72" CIDH	3.58B	0.82	-	0.96
Bent 3	72" CIDH	3.67B	0.83	-	0.97
Abut 4	24" CIDH	3.75B	0.55	3.00B	0.63

Notes:
1. Group Reduction Factors are based on pile center-to-center (CTC) and number of pile rows (LRFD Caltrans Amendments Section 10.7.2.4).

In addition to the lateral resistance provided by the piles, passive earth pressure over the leading edge of the footing at the abutments may also be counted on to resist lateral demands. Based upon the borings, the soils in which the footings are to be placed are dense silty sands. In order to mobilize this passive resistance concurrently with the lateral pile resistances, the footing must be either cast neat against undisturbed soil or the disturbed soil from the bottom of the footing up to finished grade compacted to a minimum of 95-percent of the total unit weight as determined by CTM 216 or ASTM D1557.

Using the information obtained from the subsurface investigation and the loading demands provided by T.Y. Lin, the following table provides the design pile tip elevations for the abutment and bent foundations.

Table 13. Pile Data Table for Alternative 1

Location	Pile Type	Pile Cutoff Elevation (ft)	Nominal Resistance (kips)		Design Tip Elevation (ft)	Specified Tip Elevation (ft)
			Compression	Tension		
Abut 1	24" Diameter CIDH	654.75	270	N/A	613.75 (a) 647.75 (c) 624.75 (d)	613.75
Bent 2	72" Diameter CIDH	656	1090	-220	614 (a) 637 (b) 637 (c) 586 (d)	586
Bent 3	72" Diameter CIDH	656	1080	-220	614 (a) 637 (c) 586 (d)	586
Abut 4	24" Diameter CIDH	654.75	280	N/A	613.75 (a) 647.75 (c) 624.75 (d)	613.75

Notes:
1. Design tip elevations are controlled by (a) Compression, (b) Tension, (c) Settlement, (d) Lateral Load.
2. The CIDH Specified Tip Elevation shall not be raised.

11.2.2 Alternative 2

The following table provides the required pile loadings and specified tip elevations for service limit, strength limit, and extreme event states:

Table 14. Foundation Design Recommendations – Alternative 2

Foundation Design Recommendations											
Support Location	Pile Type	Cut-off Elevation (ft)	Service-I Limit State Loads per Support (kips)		Total Permissible Support Settlement (inches)	Required Factored Nominal Resistance per Pile (kips)				Design Tip Elevation (ft)	Specified Tip Elevation (ft)
						Strength/Construction		Extreme Event			
			Total	Permanent		Comp (φ = 0.7)	Tension (φ = 0.7)	Comp (φ = 1.0)	Tension (φ = 1.0)		
Abut 1	24" CIDH	654.75	763	607	1	187	N/A	-	-	614 (a-I), 648 (c), 625 (d)	614
Bent 2	72" CIDH	656	1018	668	1	757	N/A	896	-220	608 (a-I), 613 (a-II), 637 (b-II), 633 (c), 586 (d)	586
Bent 3	72" CIDH	656	1020	667	1	756	N/A	896	-220	608 (a-I), 613 (a-II), 637 (b-II), 633 (c), 586 (d)	586
Abut 4	24" CIDH	654.75	810	653	1	194	N/A	-	-	614 (a-I), 648 (c), 625 (d)	614

Notes:
1. Design tip elevations are controlled by (a-I) Compression (Strength Limit), (b-I) Tension (Strength Limit), (a-II) Compression (Extreme Event), (b-II) Tension (Extreme Event) (c) Settlement, (d) Lateral Load.
2. The CIDH Specified Tip Elevation shall not be raised.

The following table provide the lateral forces required to induce ¼-inch, ½-inch, ¾-inch and 1-inch of lateral movement at the pile head as well as the depth to and magnitude of the maximum bending moment.

Table 15. Free Head Lateral Pile Data Table for Alternative 2

Abut 1		Lateral Load at Pile Head Deflection (kips)			
		0.25 in	0.5 in	0.75 in	1 in
Free Head	Lateral Load (kips)	30	40	47	54
	Maximum Bending Moment (kips-in)	1400	2000	2400	2700
	Depth to Maximum Bending Moment from Pile Head (feet)	6	6	6	6
Bent 2		Lateral Load at Pile Head Deflection (kips)			
		0.25 in	0.5 in	0.75 in	1 in
Free Head	Lateral Load (kips)	267	382	469	543
	Maximum Bending Moment (kips-in)	24700	35900	46300	55300
	Depth to Maximum Bending Moment from Pile Head (feet)	13	12	12	13
Bent 3		Lateral Load at Pile Head Deflection (kips)			
		0.25 in	0.5 in	0.75 in	1 in
Free Head	Lateral Load (kips)	267	382	469	543
	Maximum Bending Moment (kips-in)	24700	35900	46300	55300
	Depth to Maximum Bending Moment from Pile Head (feet)	13	12	12	13
Abut 4		Lateral Load at Pile Head Deflection (kips)			
		0.25 in	0.5 in	0.75 in	1 in
Free Head	Lateral Load (kips)	30	40	47	54
	Maximum Bending Moment (kips-in)	1400	2000	2400	2700
	Depth to Maximum Bending Moment from Pile Head (feet)	6	6	6	6

Notes:
1. The maximum bending moments is based off of the governing maximum bending moment pertaining to the leading row.
2. Free head loading condition was used to calculate the lateral capacities.

The lateral resistance values published in Table 15 should only be applied to the leading edge pile in a footing, where the piles are spaced a minimum of five pile diameters (5D) perpendicular to the direction of the loading at the abutments. A reduction value for all trailing piles has been determined from the P-Multiplier Coefficients, P_m, from LRFD Caltrans Amendments Section 10.7.2.4 for determination of the total resistance of the piled footing. The reduction factors for longitudinal and transverse loading are included in Table 16. Copies of the lateral pile analyses, which include sample calculations and a schematic of the load orientation, are included in Appendix V.3 of this report.

Table 16. Calculated P-Multipliers for Alternative 2

Support Location	Pile Type/Size	Transverse Pile Spacing	Group Reduction Factor Transverse Loading	Longitudinal Pile Spacing	Group Reduction Factor Longitudinal Loading
Abut 1	24" CIDH	3.75B	0.55	3.00B	0.63
Bent 2	72" CIDH	3.00B	0.75	-	0.90
Bent 3	72" CIDH	3.00B	0.75	-	0.90
Abut 4	24" CIDH	3.75B	0.55	3.00B	0.63

Notes:
1. Group Reduction Factors are based on pile center-to-center (CTC) and number of pile rows (LRFD Caltrans Amendments Section 10.7.2.4).

In addition to the lateral resistance provided by the piles, passive earth pressure over the leading edge of the footing at the abutments may also be counted on to resist lateral demands. Based upon the borings, the soils in which the footings are to be placed are dense silty sands. In order to mobilize this passive resistance concurrently with the lateral pile resistances, the footing must be either cast neat against undisturbed soil or the disturbed soil from the bottom of the footing up to finished grade compacted to a minimum of 95-percent of the total unit weight as determined by CTM 216 or ASTM D1557.

Using the information obtained from the subsurface investigation and the loading demands provided by T.Y. Lin, the following table provides the design pile tip elevations for the abutment and bent foundations.

Table 17. Pile Data Table for Alternative 2

Location	**Pile Type**	**Pile Cutoff Elevation (ft)**	**Nominal Resistance (kips)**		**Design Tip Elevation (ft)**	**Specified Tip Elevation (ft)**
			Compression	**Tension**

11.3 Approach Fill Earthwork

The approaches are not anticipated to be significantly raised above existing profile. No appreciable settlement will result from the placement of this minor additional fill material.

In order to place this new approach fill material for work associated with the bridge replacement, all asphalt concrete pavement should be either completely removed or pulverized in place and compacted prior to the placement of the new fill material. The existing roadway fill slopes should be completely cleared and grubbed of all plant and organic matter and have keyways cut into the existing slope faces in accordance with Section 19 Earthwork of the Caltrans Standard Specifications 2015 Edition (or latest edition).

Prior to grading for the planned approach fill, trash, debris, and vegetation should be removed from the work areas to receive new fill material. Depressions left by any such removal should be backfilled in accordance with the Standard Specifications or recommendations made in this report. Loose or soft soil identified during grading operations should be removed from within the embankment footprint and a firm subgrade should be exposed prior to placing new fill material. It is not expected that materials generated from new cuts and/or excavations will meet the requirements for structure backfill for the project and therefore, imported fill material will be required.

12 PAVEMENT RECOMMENDATIONS

12.1 Subgrade Values

The R-value testing results show the native subgrade soils are competent with a tested R-value equal to 66 which is reasonable for the description of the fill material identified in the borings. Caltrans recommends limiting design to R-value of 50. Based on the testing and the Caltrans guidance the design R-value was set to 50 to determine the new pavement sections.

12.2 Recommended New Structural Pavement Sections

New structural pavement sections will be constructed for the Bridge and its approaches. The following table, Table 9, provides the design Traffic Indices' (TI) design R-value, and structural pavement Hot Mix Asphalt (HMA) and Class 2 Aggregate Base (AB) thicknesses.

Table 18. New HMA-AB Flexible Structural Pavement Sections (R=50)

Design TI	Design R-value	HMA Thickness (inches)	Class 2 Aggregate Base Thickness (inches)
5.5	50	3"	5"
6.0	50	4"	5"

Design TI	Design R-value	HMA Thickness (inches)	Class 2 Aggregate Base Thickness (inches)
6.5	50	5”	5”
7.0	50	5”	5”
Notes: TI = Traffic Index; HMA = Hot Mix Asphalt;			

Pavement design and construction should conform to the requirements of the Caltrans *Standard Specifications, 2015 edition*. All import fill used below the new pavement sections should possess an R-value equivalent or greater than the design R-value (minimum R-Value of 50). All trench backfill for utilities and pipes underlying paved areas should be properly placed and compacted to at least 95 percent compaction (ASTM D1557 or ASTM D1557 or CTM 216) to provide a stable pavement subgrade. The upper 30 inches of all pavement subgrades should be moisture conditioned and compacted to at least 95 percent relative compaction (ASTM D1557 or CTM 216), per Caltrans Standard Specifications.

Copies of the structural pavement calculations are included in Appendix V.4.

13 CONSTRUCTION CONSIDERATIONS

All excavation and backfill work shall be performed in accordance with Section 19, Earthwork, of Caltrans’ Standard Specifications (2015 or latest edition).

13.1 Existing Structures

The proposed bridge will replace an existing bridge on the same basic alignment. Removal of the existing bridge may cause disturbance to site soils. Disturbed soils should be excavated and replaced with compacted fill (minimum 95% relative compaction per CTM 216). The proposed may affect the Jacalitos Creek Drive which is located immediately south of the existing bridge. Construction activities could potentially affect this roadway and the contractor should be aware of and implement protections this roadway.

13.2 Existing Utilities

The only identified utility at the project site is an underground AT&T communication line that runs diagonally across Lost Hills Road at the intersection with Jacalitos Creek Road. Other underground existing utilities may be present within the project area that may need to be temporarily moved or relocated.

13.3 Excavation and Shoring

All of the borings were advanced to their completion depths through the alluvial soils and existing fills without difficulty, except for Boring A-15-112 where cobbles were observed in the drill cuttings at approximately elevation 341. The contractor should be aware that cobbles could be present at shallower and deeper elevations and mobilize equipment capable of excavating cobbles during site construction activities.

The existing site soils can be classified as Cal OSHA Type C and may be prone to cave-in during construction activities. The site excavations will need benching, shoring, or laying back during construction. Design and construction of excavation sloping and shoring is the responsibility of the contractor and should be in accordance with Cal OSHA requirements.

If temporary excavations are required for construction, temporary slopes may be cut at a maximum inclination of 1.5H:1V or be supported in accordance with Cal OSHA recommendations for a Type C soil. Cuts below groundwater are not anticipated.

Due to the granular nature of the near-surface soils and possible fill materials, raveling of temporary cut slopes should be anticipated. Temporary erosion control measures, such as a flash coating, may be required for excavations open for extended periods. It is also the contractor's responsibility to assess the actual conditions in the field at the time of construction and to make its own interpretation of the Cal OSHA soil/rock type for design of the excavation and trench slopes or the need for excavation shoring.

13.4 Groundwater and Seepage

Groundwater was not encountered in the borings drilled at the site. However, the contractor should be prepared to dewater the excavations for the abutment and bent footings that may be due to any surface water infiltration. Measures such as berms and diversion ditches should be incorporated to prevent surface water from irrigation and storm water runoff from entering the excavations.

If needed, to provide a good working platform in which to place the footing concrete, the bottom of footings can be over excavated a minimum of 12-inches and Class 2 aggregate base (AB) placed up to the bottom of footing elevation, moisture conditioned, and compacted to minimum of 95-percent of the maximum dry density as determined by CTM 216. This base material will provide a clean, dry working platform in which to place the footing concrete.

13.5 Drilled Foundations

Difficulties in cast-in-drilled-hole foundation excavations are anticipated due to the following:

- Presence of dense granular soils including cobbles;
- Presence of caving granular soils; and
- Presence of utilities, potentially disturbed soil and/or construction debris from removal of existing structure.

Based upon the boring information, the borings were generally advanced through the encountered soils without difficulty using hollow-stem auger drilling equipment, though cobbles

were encountered. Boring A-16-01 encountered refusal on cobbles (boring A-16-01A) and was moved and redrilled (A-16-01B) without difficulty. The as-built LOTB for the existing bridge reported numerous cobbles in boring B-3. Generally, if the soils can be drilled with hollow-stem augers the excavations for substructures can be performed with standard heavy hydraulic excavation equipment. All excavation and backfill work shall be performed in accordance with *Section 19, Earthwork, of the State of California Department of Transportation Standard Specifications (2015).*

For the CIDH pile construction methods and means, the drilling contractor should review the boring logs to assess the excavation methods and equipment required to complete the excavation at this site. The CIDH pile excavation should be observed by an experienced geotechnical engineer to evaluate the suitability of the bearing material. Adjacent CIDH piles should not be constructed on the same day.

Based on the subsurface conditions encountered at the site, water seepage is likely to not be encountered during dry season (May to November) or to be restricted to isolated perched groundwater zones. Therefore, "wet" excavation methods will likely not be required to control seepage. Loose/medium dense sands which have the high probability of caving were encountered and may require the use of a full length segmental temporary casing to maintain a stable hole.

In order to perform the CIDH pile excavations using dry methods, the excavations should meet the following requirements:

- Have less than 6 inches of water accumulation over a one-hour period when no pumping is performed
- The sides and bottom of the excavation should remain stable during and after excavation.
- All loose material and water can be satisfactorily removed from the bottom of the excavation before inspection and concrete placement.

All shafts completed in the dry should be observed by the geotechnical engineer to evaluate the suitability of the bearing materials. The contractor should use the "wet" construction method if the above criteria cannot be satisfied.

If the CIDH piles are installed using wet methods (i.e., using drilling slurry to maintain excavation stability), we recommend that a minimum of 4 inspection tubes be installed within each of the CIDH piles to facilitate gamma-gamma and cross-hole sonic logging at completion of the pile. The contractor should also prevent the slurry from "setting up", control the sand content of the slurry to less than 4 percent by volume at any point in the excavation and maintain the slurry level a minimum of 10 feet above the highest expected piezometric head surface or tremie bottom, whichever is greater. At no time shall a CIDH pile excavation be left open or with slurry overnight. All piles excavated within one 8 hour work shift shall have concrete placed within that same 8 hour work shift.

To minimize disturbance to the bearing surfaces caused by ponding of water, it is recommended that concrete be placed the same day that the drilled shafts are completed. The bottom of the

drilled shaft excavation should be cleaned of water and loose material before placing reinforcing steel and concrete. Concrete placement should be continuous from the bottom to the top elevation of the shaft. For dry excavations, concrete can be placed by either tremie or free fall methods, however we recommend tremie placement for both wet and dry to prevent concrete aggregate separation. Wet excavated CIDH piles however will require concrete placement using tremie methods. The tremie pipe should be clean and have a suitable inside diameter for use with the specific concrete mix, but not less than 10 inches. The discharge end of the tremie should allow free radial flow of the concrete and be immersed at least 10 feet in concrete and maintain a positive pressure differential at all times during placement to prevent water or slurry intrusion.

If a full length segmental temporary casing is used, the bottom of the casing should have a minimum of 10 feet of concrete head at all times when removing the temporary segmental casing to help prevent the formation of a soil intrusion or other defect in the CIDH pile concrete.

Any materials which are generated from the grading operations and not used for fill within the project limits will need to be disposed of off-site. The Contractor shall make arrangements for disposing of the materials outside the highway right of way and shall pay all costs involved.

As no significant hazardous wastes have been identified at the time of this report and there is no reason to expect the site soils to be contaminated. One way to dispose of excess materials is to use it as daily landfill cover. Another is to use the organic materials as landscaping or farm field cover. Agreements should be in place with the receiving location/entity prior to using these methods of material disposal.

The site soils identified in the borings are most similar to Type C soils as defined by CalOSHA and temporary excavations can be made with 1.5:1 (H:V) or flatter side slopes.

Even though a permanent groundwater was not identified in the upper 50 feet of the soil column, it can be expected that transient and perched water may be encountered in the abutment excavations. We anticipate that this perched or transient water can be controlled by using a sump in the corner of the excavation to maintain a dry working area for concrete placement. Any water removed from the excavation will have to be temporarily stored and tested prior to being discharged to a permitted receiving facility.

14 LIMITATIONS

This Draft Foundation Report was performed in accordance with generally accepted geotechnical engineering principles and practices. No other warranty, expressed or implied, is made as to the conclusions and professional recommendations made in this draft report.

This Draft Foundation Report is intended for use with the Jacalitos Creek Bridge Replacement Project on Lost Hills Road located in the Fresno County, California, and all recommendations are solely for use for this project. Any changes in the design or location of the proposed new improvements, however slight, should be brought to our attention so that we may determine how they may affect our conclusions and recommendations. The conclusions and

recommendations contained in this report are based upon the data relating only to this specific project and locations discussed herein.

15 REPORT COPY LIST

This Draft Foundation Report was prepared for T.Y. Lin International for use in planning and design of the proposed Jacalitos Creek Bridge Replacement Project on Lost Hills Road.

Notes:

1. Field classification of soils was in accordance with the Caltrans Soil & Rock Logging, Classification, and Presentation Manual (2010 Edition).

2. 1.4" samples were taken using a 1.375" split barrel sampler per Standard Penetration Test (SPT) performed in accordance with ASTM D 1586–11.

3. 2.5" samples (ID = 2.5", OD = 2.9") were taken using a California Modified Sampler with liners. Samples were driven in the same manner as SPT sampler. A factor of 0.67 may be applied to California Modified Sampler blow counts to estimate SPT equivalent blow count.

4. 1.4" and 2.5" samples were taken with an automated hammer system consisting of a hammer weight of 140 lbs. free falling a distance of 30". Autohammer energy ratio (ETR) measurements indicate an ETR=87%. The last 12" of an 18" drive were recovered as the blow count number required to drive the sampler.

5. The length of each sampled interval is shown graphically on the boring log. Whole number blow counts ("N") represent the "standard penetration resistance" interval in accordance with ASTM D1586–11. Where less than 1 foot of penetration is achieved, the blow count shown is for that fraction of the "standard penetration resistance" interval actually penetrated. Where indicated by an asterisk (*) the number of blows shown is for only that fraction of the initial 6" "seating drive" interval penetration. Material characteristics shown in ( ) where estimated.

6. The blow counts shown on the logs are the raw blow counts which have not been corrected for hammer energy, sample size, overburden, or any other correction factor.

7. The apparent density of granular soil is based on a corrected Standard Penetration Test N60 value.

8. Groundwater was not encountered above rock line and was not measured below rock line due to residual drill fluid.

9. Boring locations were measuring in the field based on existing site features and correlated to topographic survey provided by T.Y.LIN INTERNATIONAL.

10. Electronic media for plan view provided by T.Y.LIN INTERNATIONAL.

LEGEND OF EARTH MATERIALS

UNIFIED SOIL CLASSIFICATION

Pt	OH	CH	MH	OL	CL	ML	SC	SM	SP	SW	GC	GM	GP	GW
Highly organic soils	Silts and clays Liquid limit greater than 50			Silts and clays Liquid limit less than 50			Sands with fines – more than 50% coarse fraction is smaller than #4 sieve		Clean sands – more than 50% coarse fraction is smaller than #4 sieve		Gravels with fines – more than 50% of coarse fraction is larger than #4 sieve		Clean gravels – more than 50% of coarse fraction is larger than #4 sieve	
							>12% fines	<5% fines			>12% fines	<5% fines		
							Fine grained soils (More than 50 % is smaller than #200 sieve)		Coarse grained soils (More than 50% is larger than #200 sieve)					

LABORATORY CLASSIFICATION CRITERIA

GW and SW – $C_u = \frac{D_{60}}{D_{10}}$ greater than 4 for GW & 6 for SW; $C_c = \frac{(D_{30})^2}{D_{10} \times D_{60}}$ between 1 & 3.

GP and SP – Clean gravel or sand not meeting requirements for GW and SW.

GM and SM – Atterberg limits below "A" line or P.I. less than 4.

SC and GC – Atterberg limits above "A" line with P.I. greater than 7.

Fines (silt w-clay)	Fine sand	Medium sand	Coarse sand	Fine gravel	Coarse gravel	Cobbles	Boulders
Sieve sizes	#200	#40	#10	#4	¾"	3"	12"

Classification of earth materials shown on this sheet is based on field inspection and should not be construed to imply laboratory analysis unless so stated.

MATERIAL SYMBOLS

- Gravel
- Sand
- Silt
- Clay
- Sandy clay or clayey sand
- Sandy silt or silty sand
- Silty clay or clayey silt
- Peat or organic matter
- Fill material
- Shale
- Sandstone
- Limestone
- Metamorphic rock
- Igneous rock

CONSISTENCY CLASSIFICATION FOR SOILS

According to the Standard Penetration Test

Nº of blows	Granular	Cohesive
0-5	Very loose	Very soft
6-10	Loose	Soft
11-20	Semicompact	Stiff
21-35	Compact	Very stiff
36-70	Dense	Hard
>70	Very dense	Very hard

LEGEND OF BORING OPERATIONS

- Plan of any boring
- Rotary boring
- Diamond core boring
- Auger boring
- Sample boring
- Jet boring
- Test pit
- 2½" Cone penetrometer
- 2½" Cone penetrometer

Appendix V.3 Pile Capacity Analysis

At the early stages of design, the SD provides preliminary foundation information to the GD using the Preliminary Foundation Design Data Sheet, shown in Table 3-2, as part of the request for a Preliminary Foundation Report

Table 3-2.

Preliminary Foundation Design Data Sheet				Estimated Max Factored Load (kips)	
Support	Foundation Type(s) Considered	Estimate of Maximum Factored Compression Loads (kips)			
Abut 1	24" CIDH Concrete Pile Group	280	per pile	195	per pile
Bent 2	72" CIDH Pile Shaft	612	per column		
Bent 3	72" CIDH Pile Shaft	609	per column		
Abut 4	24" CIDH Concrete Pile Group	280	per pile	197	per pile

Notes:

1 Estimate of maximum factored loads is not required for standard piles, rather provide Factored Nominal Structural Resistance (only at preliminary stage).
(assuming Φ=0.7 and a 400 kip nominal axial structural resistance for 24" CIDH standard pile)
(Estimated Max Factored Load for standard piles provided to right of table)

2 Maximum factored loads are estimated based on Strength Limit State load combinations.

Table 3-4. General Foundation Information to be sent from the SD to the GD

Foundation Design Data Sheet							
Support No.	Pile Type	Finished Grade Elevation (ft)	Cut-off Elevation (ft)	Pile Cap Size (ft) B	Pile Cap Size (ft) L	Permissible Settlement under Service Load (in)*	Number of Piles per Support
Abut 1	24"CIDH	658	654.75	12	36	1	10
Bent 2	72"CIDH	658	656	-	-	1	2
Bent 3	72"CIDH	658	656	-	-	1	2
Abut 4	24"CIDH	658	654.75	12	36	1	10

* Based on CALTRANS' current practice, the total permissible settlement is one inch for multispan structures with continuous spans or multi-column bents, one inch for single span structures with diaphragm abutments, and two inches for single span structures with seat abutments. Different permissible settlement under service loads may be allowed if a structural analysis verifies that required level of serviceability is met.

Table 3-5. Design Loads to be sent from the SD to the GD

Foundation Factored Design Loads

SHAFT for Windows, Version 2012.7.11

Serial Number : 158117577

VERTICALLY LOADED DRILLED SHAFT ANALYSIS

Path to file locations : G:\Projects\Y2015\P15033 Jacalitos Creek Bridge\Calculations\Shaft and LPILE\
Name of input data file : Bents 72inch.sfd
Name of output file : Bents 72inch.sfo
Name of plot output file : Bents 72inch.sfp
Name of runtime file : Bents 72inch.sfr

Time and Date of Analysis

Date: May 20, 2016 Time: 16:20:25

New Pile

PROPOSED DEPTH = 50.0 FT

NUMBER OF LAYERS = 1

WATER TABLE DEPTH = 0.0 FT.

SOIL INFORMATION

LAYER NO 1----SAND

AT THE TOP

SKIN FRICTION COEFFICIENT- BETA	= 0.120E+01
UNDRAINED SHEAR STRENGTH, LB/SQ FT	= 0.000E+00
INTERNAL FRICTION ANGLE, DEG.	= 0.380E+02
BLOWS PER FOOT FROM STANDARD PENETRATION TEST	= 0.000E+00
SOIL UNIT WEIGHT, LB/CU FT	= 0.130E+03
MAXIMUM LOAD TRANSFER FOR SOIL, LB/SQ FT	= 0.400E+04
DEPTH, FT	= 0.000E+00

AT THE BOTTOM

SKIN FRICTION COEFFICIENT- BETA	= 0.454E+00
UNDRAINED SHEAR STRENGTH, LB/SQ FT	= 0.000E+00
INTERNAL FRICTION ANGLE, DEG.	= 0.380E+02
BLOWS PER FOOT FROM STANDARD PENETRATION TEST	= 0.000E+00
SOIL UNIT WEIGHT, LB/CU FT	= 0.130E+03
MAXIMUM LOAD TRANSFER FOR SOIL, LB/SQ FT	= 0.400E+04
DEPTH, FT	= 0.600E+02

LRFD RESISTANCE FACTOR (SIDE FRICTION)	= 0.100E+01
LRFD RESISTANCE FACTOR (TIP RESISTANCE)	= 0.100E+01

DRILLED SHAFT INFORMATION

DIAMETER OF STEM	= 6.000	FT.
DIAMETER OF BASE	= 6.000	FT.
END OF STEM TO BASE	= 0.000	FT.
ANGLE OF BELL	= 0.000	DEG.
IGNORED TOP PORTION	= 5.000	FT.
IGNORED BOTTOM PORTION	= 0.000	FT.
AREA OF ONE PERCENT STEEL	= 40.720	SQ.IN.
ELASTIC MODULUS, Ec	= 0.360E+07	LB/SQ IN
VOLUME OF UNDERREAM	= 0.000	CU.YDS.

PREDICTED RESULTS

QS = ULTIMATE SIDE RESISTANCE;
QB = ULTIMATE BASE RESISTANCE;
WT = WEIGHT OF DRILLED SHAFT (UPLIFT CAPACITY ONLY);
QU = TOTAL ULTIMATE RESISTANCE;
LRFD QS = TOTAL SIDE FRICTION USING LRFD RESISTANCE FACTOR TO THE ULTIMATE SIDE RESISTANCE;
LRFD QB = TOTAL BASE BEARING USING LRFD RESISTANCE FACTOR TO THE ULTIMATE BASE RESISTANCE
LRFD QU = TOTAL CAPACITY WITH LRFD RESISTANCE FACTOR.

New Pile

PROPOSED DEPTH = 50.0 FT

REDUCTION FACTOR APPLIED FOR UPLIFT FRICTION = 1.000

NUMBER OF LAYERS = 1

WATER TABLE DEPTH = 0.0 FT.

SOIL INFORMATION

LAYER NO 1----SAND

AT THE TOP

SKIN FRICTION COEFFICIENT- BETA	= 0.120E+01
UNDRAINED SHEAR STRENGTH, LB/SQ FT	= 0.000E+00
INTERNAL FRICTION ANGLE, DEG.	= 0.380E+02
BLOWS PER FOOT FROM STANDARD PENETRATION TEST	= 0.000E+00
SOIL UNIT WEIGHT, LB/CU FT	= 0.130E+03
MAXIMUM LOAD TRANSFER FOR SOIL, LB/SQ FT	= 0.400E+04
DEPTH, FT	= 0.000E+00

AT THE BOTTOM

SKIN FRICTION COEFFICIENT- BETA	= 0.454E+00
UNDRAINED SHEAR STRENGTH, LB/SQ FT	= 0.000E+00
INTERNAL FRICTION ANGLE, DEG.	= 0.380E+02
BLOWS PER FOOT FROM STANDARD PENETRATION TEST	= 0.000E+00
SOIL UNIT WEIGHT, LB/CU FT	= 0.130E+03
MAXIMUM LOAD TRANSFER FOR SOIL, LB/SQ FT	= 0.400E+04
DEPTH, FT	= 0.600E+02

LRFD RESISTANCE FACTOR (SIDE FRICTION)	= 0.100E+01
LRFD RESISTANCE FACTOR (TIP RESISTANCE)	= 0.100E+01

DRILLED SHAFT INFORMATION

DIAMETER OF STEM	= 6.000	FT.
DIAMETER OF BASE	= 6.000	FT.
END OF STEM TO BASE	= 0.000	FT.
ANGLE OF BELL	= 0.000	DEG.
IGNORED TOP PORTION	= 5.000	FT.
IGNORED BOTTOM PORTION	= 0.000	FT.
AREA OF ONE PERCENT STEEL	= 40.720	SQ.IN.
ELASTIC MODULUS, Ec	= 0.360E+07	LB/SQ IN
VOLUME OF UNDERREAM	= 0.000	CU.YDS.

PREDICTED RESULTS

QS = ULTIMATE SIDE RESISTANCE;
QB = ULTIMATE BASE RESISTANCE;
WT = WEIGHT OF DRILLED SHAFT (UPLIFT CAPACITY ONLY);
QU = TOTAL ULTIMATE RESISTANCE;
LRFD QS = TOTAL SIDE FRICTION USING LRFD RESISTANCE FACTOR TO THE ULTIMATE SIDE RESISTANCE;
LRFD QB = TOTAL BASE BEARING USING LRFD RESISTANCE FACTOR TO THE ULTIMATE BASE RESISTANCE
LRFD QU = TOTAL CAPACITY WITH LRFD RESISTANCE FACTOR.

Date and Time of Analysis

Date: May 20, 2016 Time: 16:25:59

Problem Title

Project Name: Jacalitos Creek Bridge Replacement on Lost Hills Avenue

Bridge Number: 42C0078

Client: Fresno County

Engineer: J NEWGARD

Description: Lateral capacity of CIDH piles

Program Options and Settings

Engineering Units of Input Data and Computations:
- Engineering units are US Customary Units (pounds, feet, inches)

Analysis Control Options:

- Maximum number of iterations allowed	=	500
- Deflection tolerance for convergence	=	1.0000E-05 in
- Maximum allowable deflection	=	100.0000 in
- Number of pile increments	=	100

Loading Type and Number of Cycles of Loading:
- Static loading specified

Computational Options:
- Use unfactored loads in computations (conventional analysis)
- Compute pile response under loading and nonlinear bending properties of pile (only if nonlinear pile properties are input)
- Use of p-y modification factors for p-y curves not selected
- Loading by lateral soil movements acting on pile not selected
- Input of shear resistance at the pile tip not selected
- Computation of pile-head foundation stiffness matrix not selected
- Push-over analysis of pile not selected
- Buckling analysis of pile not selected

Output Options:
 - No p-y curves to be computed and reported for user-specified depths
 - Values of pile-head deflection, bending moment, shear force, and
   soil reaction are printed for full length of pile.
 - Printing Increment (nodal spacing of output points) = 1

Pile Structural Properties and Geometry

Total number of pile sections = 1

Total length of pile = 100.00 ft

Depth of ground surface below top of pile = 0.00 ft

Pile diameter values used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over
the length of the pile.

Point	Depth X ft	Pile Diameter in
1	0.00000	24.0000000
2	100.000000	24.0000000

Input Structural Properties:

Pile Section No. 1:

   Section Type = Drilled Shaft (Bored Pile)
   Section Length = 100.00000 ft
   Section Diameter = 24.00000 in

Ground Slope and Pile Batter Angles

Ground Slope Angle = 0.000 degrees
= 0.000 radians

Pile Batter Angle = 0.000 degrees
= 0.000 radians

Soil and Rock Layering Information

The soil profile is modelled using 2 layers

Layer 1 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer = 0.0000 ft
   Distance from top of pile to bottom of layer = 10.00000 ft
   Effective unit weight at top of layer = 120.00000 pcf
   Effective unit weight at bottom of layer = 125.00000 pcf
   Friction angle at top of layer = 36.00000 deg.
   Friction angle at bottom of layer = 40.00000 deg.
   Subgrade k at top of layer = 200.00000 pci
   Subgrade k at bottom of layer = 225.00000 pci

Layer 2 is sand, p-y criteria by Reese et al., 1974

   Distance from top of pile to top of layer = 10.00000 ft
   Distance from top of pile to bottom of layer = 100.00000 ft
   Effective unit weight at top of layer = 125.00000 pcf
   Effective unit weight at bottom of layer = 125.00000 pcf
   Friction angle at top of layer = 40.00000 deg.
   Friction angle at bottom of layer = 40.00000 deg.
   Subgrade k at top of layer = 225.00000 pci
   Subgrade k at bottom of layer = 225.00000 pci

   (Depth of lowest soil layer extends 0.00 ft below pile tip)

Summary of Soil Properties

Layer Num.	Soil Type (p-y Curve Criteria)	Layer Depth ft	Effective Unit Wt. pcf	Angle of Friction deg.	kpy pci

1	Sand (Reese, et al.)	0.00	120.000	36.000
200.000				
		10.000	125.000	40.000
225.000				
2	Sand (Reese, et al.)	10.000	125.000	40.000
225.000				
		100.000	125.000	40.000
225.000				

Loading Type

Static loading criteria were used when computing p-y curves for all analyses.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 4

Load No.	Load Compute Type	Condition 1	Condition 2	Axial Thrust Force, lbs
Top y vs. Pile Length				
1	4 No	y = 0.25000 in	M = 0.0000 in-lbs	194000.
2	4 No	y = 0.50000 in	M = 0.0000 in-lbs	194000.
3	4 No	y = 0.75000 in	M = 0.0000 in-lbs	194000.
4	4 No	y = 1.00000 in	M = 0.0000 in-lbs	194000.

V = perpendicular shear force applied to pile head
M = bending moment applied to pile head
y = lateral deflection relative to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applie to pile head
Axial thrust is assumed to be acting axially for all pile batter angles.

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

---

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:

Dimensions and Properties of Drilled Shaft (Bored Pile):

Length of Section	=	100.00000 ft
Shaft Diameter	=	24.00000 in
Concrete Cover Thickness	=	3.00000 in
Number of Reinforcing Bars	=	6 bars
Yield Stress of Reinforcing Bars	=	60000. psi
Modulus of Elasticity of Reinforcing Bars	=	29000000. psi
Gross Area of Shaft	=	452.38934 sq. in.
Total Area of Reinforcing Steel	=	4.74000 sq. in.
Area Ratio of Steel Reinforcement	=	1.05 percent
Edge-to-Edge Bar Spacing	=	7.50000 in
Maximum Concrete Aggregate Size	=	0.75000 in
Ratio of Bar Spacing to Aggregate Size	=	10.00
Offset of Center of Rebar Cage from Center of Pile	=	0.0000 in

Axial Structural Capacities:

Nom. Axial Structural Capacity = 0.85 Fc Ac + Fy As	=	1425.906 kips
Tensile Load for Cracking of Concrete	=	-177.999 kips
Nominal Axial Tensile Capacity	=	-284.400 kips

Reinforcing Bar Dimensions and Positions Used in Computations:

Bar Number	Bar Diam. inches	Bar Area sq. in.	X inches	Y inches
1	1.00000	0.79000	8.50000	0.00000
2	1.00000	0.79000	4.25000	7.36122
3	1.00000	0.79000	-4.25000	7.36122
4	1.00000	0.79000	-8.50000	0.00000
5	1.00000	0.79000	-4.25000	-7.36122

6	1.00000	0.79000	4.25000	-7.36122

NOTE: The positions of the above rebars were computed by LPile

Minimum spacing between any two bars not equal to zero = 7.50000 inches
between Bars 4 and 5

Spacing to aggregate size ratio = 10.00000

Concrete Properties:

Compressive Strength of Concrete	=	3000.00000 psi
Modulus of Elasticity of Concrete	=	3122019. psi
Modulus of Rupture of Concrete	=	-410.79191 psi
Compression Strain at Peak Stress	=	0.00163
Tensile Strain at Fracture of Concrete	=	-0.0001160
Maximum Coarse Aggregate Size	=	0.75000 in

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

Number	Axial Thrust Force kips
1	194.000

Definitions of Run Messages and Notes:

C = concrete in section has cracked in tension.
Y = stress in reinforcing steel has reached yield stress.
T = ACI 318-08 criteria for tension-controlled section met, tensile strain in reinforcement exceeds 0.005 while simultaneously compressive strain in concrete more than than 0.003. See ACI 318-08, Section 10.3.4.
Z = depth of tensile zone in concrete section is less than 10 percent of section depth.

Bending Stiffness (EI) = Computed Bending Moment / Curvature.
Position of neutral axis is measured from edge of compression side of pile.
Compressive stresses and strains are positive in sign.
Tensile stresses and strains are negative in sign.

Axial Thrust Force = 194.000 kips

Bending Max Concrete Curvature rad/in.	Bending Max Steel Stress ksi	Bending Run Moment in-kip	Stiffness Msg kip-in2	Depth to N Axis in	Max Comp Strain in/in	Max Tens Strain in/in

-------------------------------------------------------------------------------
   Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1
-------------------------------------------------------------------------------

Moment values interpolated at maximum compressive strain = 0.003
```

or maximum developed moment if pile fails at smaller strains.

Load No.	Axial Thrust kips	Nominal Mom. Cap. in-kip	Max. Comp. Strain
1	194.000	3489.257	0.00300000

Note note that the values of moment capacity in the table above are not factored by a strength reduction factor (phi-factor).

In ACI 318-08, the value of the strength reduction factor depends on whether the transverse reinforcing steel bars are tied hoops (0.65) or spirals (0.70).

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to ACI 318-08, Section 9.3.2.2 or the value required by the design standard being followed.

The following table presents factored moment capacities and corresponding bending stiffnesses computed for common resistance factor values used for reinforced concrete sections.

Axial Load No.	Resistance Factor for Moment	Nominal Moment Capacity in-kip	Ultimate (Factored) Axial Thrust kips	Ultimate (Factored) Moment Capacity in-kip	Bending Stiffness at Ult. Mom. Cap. kip-in^2
1	0.65	3489.257	126.100	2268.017	21358239.660
1	0.70	3489.257	135.800	2442.480	20006112.346
1	0.75	3489.257	145.500	2616.943	18880773.982

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head = 0.250000 inches

Moment at pile head = 0.0 in-lbs
Axial load at pile head = 194000.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. Es*h lb/in	Soil Spr. Lat. Load lb/inch	Distrib. p lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 1:

```
Pile-head deflection             =      0.2500000 inches
Computed slope at pile head      =     -0.0032673 radians
Maximum bending moment           =       1423970. inch-lbs
Maximum shear force              =         30462. lbs
Depth of maximum bending moment  =      6.0000000 feet below pile head
Depth of maximum shear force     =       0.000000 feet below pile head
Number of iterations             =             14
Number of zero deflection points =             10
```

Computed Values of Pile Loading and Deflection

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head = 0.500000 inches
Moment at pile head = 0.0 in-lbs
Axial load at pile head = 194000.0 lbs

Depth X	Deflect. y	Bending Moment	Shear Force	Slope S	Total Stress	Bending Stiffness	Soil Res. Es*h	Soil Spr. Distrib. p Lat. Load

* This analysis computed pile response using nonlinear moment-curvature
relationships.
  Values of total stress due to combined axial and bending stresses are computed
only
  for elastic sections only and do not equal the actual stresses in concrete and
steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the
pile.

Output Summary for Load Case No. 2:

Pile-head deflection             =      0.5000000 inches
Computed slope at pile head      =     -0.0064018 radians
Maximum bending moment           =       1949607. inch-lbs
Maximum shear force              =          39961. lbs
Depth of maximum bending moment  =      6.0000000 feet below pile head
Depth of maximum shear force     =       0.000000 feet below pile head
Number of iterations             =             11
Number of zero deflection points =             10
```

```
---------------------------------------------------------------------------
                Computed Values of Pile Loading and Deflection
                  for Lateral Loading for Load Case Number 3
---------------------------------------------------------------------------

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head                              =     0.750000 inches
Moment at pile head                                    =          0.0 in-lbs
Axial load at pile head                                =     194000.0 lbs

* This analysis computed pile response using nonlinear moment-curvature
relationships.
  Values of total stress due to combined axial and bending stresses are computed
only
  for elastic sections only and do not equal the actual stresses in concrete and
steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the
pile.

Output Summary for Load Case No. 3:

Pile-head deflection             =      0.7500000 inches
Computed slope at pile head      =     -0.0095002 radians
Maximum bending moment           =       2356730. inch-lbs
```

Maximum shear force = 47086. lbs
Depth of maximum bending moment = 6.0000000 feet below pile head
Depth of maximum shear force = 0.000000 feet below pile head
Number of iterations = 12
Number of zero deflection points = 10

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 4

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head = 1.000000 inches
Moment at pile head = 0.0 in-lbs
Axial load at pile head = 194000.0 lbs

Depth X	Deflect. y	Bending Moment	Shear Force	Slope S	Total Stress	Bending Stiffness	Soil Res. Spr. Es*h	Distrib. p Lat. Load

* This analysis computed pile response using nonlinear moment-curvature relationships.
  Values of total stress due to combined axial and bending stresses are computed only
  for elastic sections only and do not equal the actual stresses in concrete and steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the pile.

```
Output Summary for Load Case No. 4:

Pile-head deflection             =      1.0000000 inches
Computed slope at pile head      =     -0.0125479 radians
Maximum bending moment           =       2712983. inch-lbs
Maximum shear force              =         53319. lbs
Depth of maximum bending moment  =      6.0000000 feet below pile head
Depth of maximum shear force     =       0.000000 feet below pile head
Number of iterations             =             12
Number of zero deflection points =             10
```

Summary of Pile Response(s)

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, lbs, and Load 2 = Moment, in-lbs
Load Type 2: Load 1 = Shear, lbs, and Load 2 = Slope, radians
Load Type 3: Load 1 = Shear, lbs, and Load 2 = Rotational Stiffness, in-lbs/radian
Load Type 4: Load 1 = Top Deflection, inches, and Load 2 = Moment, in-lbs
Load Type 5: Load 1 = Top Deflection, inches, and Load 2 = Slope, radians

Load Case	Load Type	Pile-head Condition 1 V(lbs) or y(inches)	Pile-head Condition 2 in-lb, rad., or in-lb/rad.	Maximum Axial Loading lbs	Maximum Pile-head Deflection inches	Moment in Pile No. in-lbs	Shear in Pile No. lbs	Rotation radians
1	4	y = 0.2500	M = 0.000	194000.	0.25000000	1423970.	30462.	-0.00326729
2	4	y = 0.5000	M = 0.000	194000.	0.50000000	1949607.	39961.	-0.00640182
3	4	y = 0.7500	M = 0.000	194000.	0.75000000	2356730.	47086.	-0.00950021
4	4	y = 1.0000	M = 0.000	194000.	1.00000000	2712983.	53319.	-0.01254788

The analysis ended normally.

Date and Time of Analysis

Date: May 20, 2016 Time: 16:26:53

Problem Title

Project Name: Jacalitos Creek Bridge Replacement on Lost Hills Avenue

Bridge Number: 42C0078

Client: Fresno County

Engineer: J NEWGARD

Description: Lateral capacity of CIDH piles

Program Options and Settings

Engineering Units of Input Data and Computations:
- Engineering units are US Customary Units (pounds, feet, inches)

Analysis Control Options:

- Maximum number of iterations allowed	=	500
- Deflection tolerance for convergence	=	1.0000E-05 in
- Maximum allowable deflection	=	100.0000 in
- Number of pile increments	=	100

Loading Type and Number of Cycles of Loading:
- Static loading specified

Computational Options:
- Use unfactored loads in computations (conventional analysis)
- Compute pile response under loading and nonlinear bending properties of pile (only if nonlinear pile properties are input)
- Use of p-y modification factors for p-y curves not selected
- Loading by lateral soil movements acting on pile not selected
- Input of shear resistance at the pile tip not selected
- Computation of pile-head foundation stiffness matrix not selected
- Push-over analysis of pile not selected
- Buckling analysis of pile not selected

Output Options:
 - No p-y curves to be computed and reported for user-specified depths
 - Values of pile-head deflection, bending moment, shear force, and
   soil reaction are printed for full length of pile.
 - Printing Increment (nodal spacing of output points) = 1

Pile Structural Properties and Geometry

Total number of pile sections = 1

Total length of pile = 100.00 ft

Depth of ground surface below top of pile = 0.00 ft

Pile diameter values used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over the length of the pile.

Point	Depth X ft	Pile Diameter in
1	0.00000	72.0000000
2	100.000000	72.0000000

Input Structural Properties:

Pile Section No. 1:

Section Type = Drilled Shaft (Bored Pile)
Section Length = 100.00000 ft
Section Diameter = 72.00000 in

Ground Slope and Pile Batter Angles

Ground Slope Angle = 0.000 degrees
= 0.000 radians

Pile Batter Angle = 0.000 degrees
= 0.000 radians

Soil and Rock Layering Information

The soil profile is modelled using 2 layers

Layer 1 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer = 0.0000 ft
Distance from top of pile to bottom of layer = 10.00000 ft
Effective unit weight at top of layer = 120.00000 pcf
Effective unit weight at bottom of layer = 125.00000 pcf
Friction angle at top of layer = 36.00000 deg.
Friction angle at bottom of layer = 40.00000 deg.
Subgrade k at top of layer = 0.0000 pci
Subgrade k at bottom of layer = 0.0000 pci

NOTE: Internal default values for subgrade k will be computed for this soil layer.

Layer 2 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer = 10.00000 ft
Distance from top of pile to bottom of layer = 100.00000 ft
Effective unit weight at top of layer = 125.00000 pcf
Effective unit weight at bottom of layer = 125.00000 pcf
Friction angle at top of layer = 40.00000 deg.
Friction angle at bottom of layer = 40.00000 deg.
Subgrade k at top of layer = 0.0000 pci
Subgrade k at bottom of layer = 0.0000 pci

NOTE: Internal default values for subgrade k will be computed for this soil layer.

(Depth of lowest soil layer extends 0.00 ft below pile tip)

Summary of Soil Properties

Layer Layer Effective Angle of

Layer Num.	Soil Type (p-y Curve Criteria)	Depth ft	Unit Wt. pcf	Friction deg.	kpy pci
1	Sand (Reese, et al.)	0.00	120.000	36.000	default
		10.000	125.000	40.000	default
2	Sand (Reese, et al.)	10.000	125.000	40.000	default
		100.000	125.000	40.000	default

Loading Type

Static loading criteria were used when computing p-y curves for all analyses.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 4

Load No.	Load Compute Type	Condition 1	Condition 2	Axial Thrust Force, lbs	Top y vs. Pile Length
1	4 No	y = 0.25000 in	M = 0.0000 in-lbs	706000.	
2	4 No	y = 0.50000 in	M = 0.0000 in-lbs	706000.	
3	4 No	y = 0.75000 in	M = 0.0000 in-lbs	706000.	
4	4 No	y = 1.00000 in	M = 0.0000 in-lbs	706000.	

V = perpendicular shear force applied to pile head
M = bending moment applied to pile head

y = lateral deflection relative to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applie to pile head
Axial thrust is assumed to be acting axially for all pile batter angles.

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

---

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:

Dimensions and Properties of Drilled Shaft (Bored Pile):

Length of Section	=	100.00000 ft
Shaft Diameter	=	72.00000 in
Concrete Cover Thickness	=	5.00000 in
Number of Reinforcing Bars	=	16 bars
Yield Stress of Reinforcing Bars	=	60000. psi
Modulus of Elasticity of Reinforcing Bars	=	29000000. psi
Gross Area of Shaft	=	4071.50408 sq. in.
Total Area of Reinforcing Steel	=	64.00000 sq. in.
Area Ratio of Steel Reinforcement	=	1.57 percent
Edge-to-Edge Bar Spacing	=	9.39828 in
Maximum Concrete Aggregate Size	=	0.75000 in
Ratio of Bar Spacing to Aggregate Size	=	12.53
Offset of Center of Rebar Cage from Center of Pile	=	0.0000 in

Axial Structural Capacities:

Nom. Axial Structural Capacity = 0.85 Fc Ac + Fy As	=	14059.136 kips
Tensile Load for Cracking of Concrete	=	-1666.023 kips
Nominal Axial Tensile Capacity	=	-3840.000 kips

Reinforcing Bar Dimensions and Positions Used in Computations:

Bar Number	Bar Diam. inches	Bar Area sq. in.	X inches	Y inches
1	2.25700	4.00000	29.87150	0.00000

2	2.25700	4.00000	27.59767	11.43133
3	2.25700	4.00000	21.12234	21.12234
4	2.25700	4.00000	11.43133	27.59767
5	2.25700	4.00000	0.00000	29.87150
6	2.25700	4.00000	-11.43133	27.59767
7	2.25700	4.00000	-21.12234	21.12234
8	2.25700	4.00000	-27.59767	11.43133
9	2.25700	4.00000	-29.87150	0.00000
10	2.25700	4.00000	-27.59767	-11.43133
11	2.25700	4.00000	-21.12234	-21.12234
12	2.25700	4.00000	-11.43133	-27.59767
13	2.25700	4.00000	0.00000	-29.87150
14	2.25700	4.00000	11.43133	-27.59767
15	2.25700	4.00000	21.12234	-21.12234
16	2.25700	4.00000	27.59767	-11.43133

NOTE: The positions of the above rebars were computed by LPile

Minimum spacing between any two bars not equal to zero = 9.39828 inches
between Bars 15 and 16

Spacing to aggregate size ratio = 12.53104

Concrete Properties:

Compressive Strength of Concrete	=	3000.00000 psi
Modulus of Elasticity of Concrete	=	3122019. psi
Modulus of Rupture of Concrete	=	-410.79191 psi
Compression Strain at Peak Stress	=	0.00163
Tensile Strain at Fracture of Concrete	=	-0.0001160
Maximum Coarse Aggregate Size	=	0.75000 in

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

Number	Axial Thrust Force kips
1	706.000

Definitions of Run Messages and Notes:

C = concrete in section has cracked in tension.

Y = stress in reinforcing steel has reached yield stress.
T = ACI 318-08 criteria for tension-controlled section met, tensile strain in reinforcement exceeds 0.005 while simultaneously compressive strain in concrete more than than 0.003. See ACI 318-08, Section 10.3.4.
Z = depth of tensile zone in concrete section is less than 10 percent of section depth.

Bending Stiffness (EI) = Computed Bending Moment / Curvature.
Position of neutral axis is measured from edge of compression side of pile.
Compressive stresses and strains are positive in sign.
Tensile stresses and strains are negative in sign.

Axial Thrust Force = 706.000 kips

Bending Max Concrete Curvature Stress rad/in. ksi	Bending Max Steel Moment Stress in-kip ksi	Bending Run Stiffness Msg kip-in2	Depth to N Axis in	Max Comp Strain in/in	Max Tens Strain in/in

Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1

Moment values interpolated at maximum compressive strain = 0.003
or maximum developed moment if pile fails at smaller strains.

Load No.	Axial Thrust kips	Nominal Mom. Cap. in-kip	Max. Comp. Strain
1	706.000	111889.797	0.00300000

Note note that the values of moment capacity in the table above are not
factored by a strength reduction factor (phi-factor).

In ACI 318-08, the value of the strength reduction factor depends on whether
the transverse reinforcing steel bars are tied hoops (0.65) or spirals (0.70).

The above values should be multiplied by the appropriate strength reduction
factor to compute ultimate moment capacity according to ACI 318-08, Section
9.3.2.2 or the value required by the design standard being followed.

The following table presents factored moment capacities and corresponding

bending stiffnesses computed for common resistance factor values used for
reinforced concrete sections.

Load No.	Axial Resistance Factor for Moment	Nominal Moment Capacity in-kip	Ultimate (Factored) Axial Thrust kips	Ultimate (Factored) Bending Stiffness Moment Capacity at Ult. Mom. Cap. in-kip kip-in^2
1	0.65	111889.797	458.900	72728.365 1779578068.051
1	0.70	111889.797	494.200	78322.856 1748086349.133
1	0.75	111889.797	529.500	83917.348 1719565356.398

Computed Values of Pile Loading and Deflection
for Lateral Loading for Load Case Number 1

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head = 0.250000 inches
Moment at pile head = 0.0 in-lbs
Axial load at pile head = 706000.0 lbs

Depth X	Deflect. y	Bending Moment	Shear Force	Slope S	Total Stress	Bending Stiffness	Soil Res. Soil Spr. Es*h	Distrib. p Lat. Load

* This analysis computed pile response using nonlinear moment-curvature
relationships.
  Values of total stress due to combined axial and bending stresses are computed
only
  for elastic sections only and do not equal the actual stresses in concrete and
steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the
pile.

Output Summary for Load Case No. 1:

Pile-head deflection             =      0.2500000 inches
Computed slope at pile head      =     -0.0015042 radians
Maximum bending moment           =      24619988. inch-lbs
Maximum shear force              =        268399. lbs
Depth of maximum bending moment  =     12.0000000 feet below pile head
Depth of maximum shear force     =       0.000000 feet below pile head
Number of iterations             =             34
Number of zero deflection points =              4

--------------------------------------------------------------------------------
                Computed Values of Pile Loading and Deflection
                  for Lateral Loading for Load Case Number 2
--------------------------------------------------------------------------------

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head                          =     0.500000 inches
Moment at pile head                                =          0.0 in-lbs
Axial load at pile head                            =     706000.0 lbs

* This analysis computed pile response using nonlinear moment-curvature
relationships.
  Values of total stress due to combined axial and bending stresses are computed
only
  for elastic sections only and do not equal the actual stresses in concrete and
steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the
pile.

Output Summary for Load Case No. 2:

Pile-head deflection             =      0.5000000 inches
Computed slope at pile head      =     -0.0031190 radians
Maximum bending moment           =      37499514. inch-lbs
Maximum shear force              =        392187. lbs
Depth of maximum bending moment  =     12.0000000 feet below pile head
Depth of maximum shear force     =       0.000000 feet below pile head
Number of iterations             =             23
Number of zero deflection points =              4

--------------------------------------------------------------------------------
                Computed Values of Pile Loading and Deflection
                  for Lateral Loading for Load Case Number 3
--------------------------------------------------------------------------------

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head                              =     0.750000 inches
Moment at pile head                                    =          0.0 in-lbs
Axial load at pile head                                =     706000.0 lbs

* This analysis computed pile response using nonlinear moment-curvature
relationships.
  Values of total stress due to combined axial and bending stresses are computed
only
  for elastic sections only and do not equal the actual stresses in concrete and
steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the
pile.

Output Summary for Load Case No. 3:

Pile-head deflection             =      0.7500000 inches
Computed slope at pile head      =     -0.0046409 radians
Maximum bending moment           =       48887766. inch-lbs
Maximum shear force              =         487523. lbs
Depth of maximum bending moment  =     13.0000000 feet below pile head
Depth of maximum shear force     =       0.000000 feet below pile head
Number of iterations             =             30
Number of zero deflection points =              4

--------------------------------------------------------------------------------
                Computed Values of Pile Loading and Deflection
                  for Lateral Loading for Load Case Number 4
--------------------------------------------------------------------------------

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head                          =     1.000000 inches
Moment at pile head                                =          0.0 in-lbs
Axial load at pile head                            =     706000.0 lbs

* This analysis computed pile response using nonlinear moment-curvature
relationships.
  Values of total stress due to combined axial and bending stresses are computed
only
  for elastic sections only and do not equal the actual stresses in concrete and
steel.
  Stresses in concrete and steel may be interpolated from the output for nonlinear
  bending properties relative to the magnitude of bending moment developed in the
pile.

Output Summary for Load Case No. 4:

Pile-head deflection             =      1.0000000 inches
Computed slope at pile head      =     -0.0060666 radians
Maximum bending moment           =      59089359. inch-lbs
Maximum shear force              =        568916. lbs
Depth of maximum bending moment  =     13.0000000 feet below pile head
Depth of maximum shear force     =       0.000000 feet below pile head
Number of iterations             =             11
Number of zero deflection points =              4

--------------------------------------------------------------------------------
                           Summary of Pile Response(s)
--------------------------------------------------------------------------------
```

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, lbs, and Load 2 = Moment, in-lbs
Load Type 2: Load 1 = Shear, lbs, and Load 2 = Slope, radians
Load Type 3: Load 1 = Shear, lbs, and Load 2 = Rotational Stiffness, in-lbs/radian
Load Type 4: Load 1 = Top Deflection, inches, and Load 2 = Moment, in-lbs
Load Type 5: Load 1 = Top Deflection, inches, and Load 2 = Slope, radians

Maximum Load Case No.	Load Type No.	Pile-head Condition 1 Shear V(lbs) or y(inches)	Pile-head Condition 2 in-lb, rad., or in-lb/rad.	Maximum Axial Loading lbs	Maximum Pile-head Deflection inches	Moment in Pile in-lbs
1	4	y = 0.2500	M = 0.000	706000.	0.25000000	24619988.
2	4	y = 0.5000	M = 0.000	706000.	0.50000000	37499514.
3	4	y = 0.7500	M = 0.000	706000.	0.75000000	48887766.
4	4	y = 1.0000	M = 0.000	706000.	1.00000000	59089359.
		268399.	-0.00150423			
		392187.	-0.00311900

GENERAL NOTES
LOAD AND RESISTANCE FACTOR DESIGN

DESIGN: AASHTO LRFD Bridge Design Specifications, 8th edition and the Caltrans Amendments, preface dated April 2019.

SEISMIC DESIGN:
Caltrans Seismic Design Criteria (SDC), version 2.0, dated April 2019.

DEAD LOAD:
Includes 35 psf for future wearing surface and utilities.

LIVE LOADING:
HL93 and permit design load.

SEISMIC LOADING:
Soil profile V_{30} = 280 m/sec
Moment Magnitude M_{max} = 6.7
Peak Ground Acceleration = 0.66g

REINFORCED CONCRETE:
f_y = 60,000 psi

f'_c = See "CONCRETE STRENGTHS AND TYPE LIMITS" on "DECK CONTOURS" sheet.
n = varies

PRESTRESSED CONCRETE:

See "PRESTRESSING NOTES" on "LONGITUDINAL SECTION" sheet.

HYDROLOGIC SUMMARY

Drainage area: 62.3 Square Miles

	Design Flood	Base Flood
Frequency (years)	50	100
Discharge (cubic feet per second)	5,710	7,430
Water Surface Elev at Bridge (ft)	665.68	666.69

Flood plain data based upon information available when the plans were prepared and are shown to meet Federal requirements. The accuracy of said information is not warranted by the County and interested or affected parties should make their own investigations.

Legend:

X.X — Indicates bottom of footing elevation

Existing columns to be removed

SCOUR DATA TABLE

SUPPORT NO.	LONG TERM (DEGRADATION AND CONTRACTION) SCOUR ELEVATION (ft)	SHORT TERM (LOCAL) SCOUR DEPTH (ft)
Abut 1	652.00	6.3
Bent 2	652.00	10.8
Bent 3	652.00	11.9
Abut 4	652.00	11.6

PILE DATA TABLE

LOCATION	PILE TYPE	CUT-OFF ELEVATION (Ft)	NOMINAL RESISTANCE		DESIGN TIP ELEVATION	SPECIFIED TIP ELEVATION
			COMPRESSION	TENSION		
Abut 1	30"ø CIDH	649.25	330	N/A	614(a)	612.0
Bent 2	36"ø CIDH	652	1,360	N/A	587 (a)	585.0
Bent 3	36"ø CIDH	652	1,360	N/A	587 (a)	585.0
Abut 4	30"ø CIDH	649.25	345	N/A	614 (a)	612.0

(1) Design Tip Elevation is controlled by (a) Compression (Strength Limit).
(2) The Specified Tip Elevation shall not be raised above the design tip elevations for tension load, lateral load, and tolerable settlement.
(3) Slurry Displacement method may be used for concrete placement of the CIDH piles. Therefore, the specified pile tip elevationsare two feet below the design tip elevations to account for the zone of untested concrete due to the limitation of the gamma-gamma logging equipment

PLAN
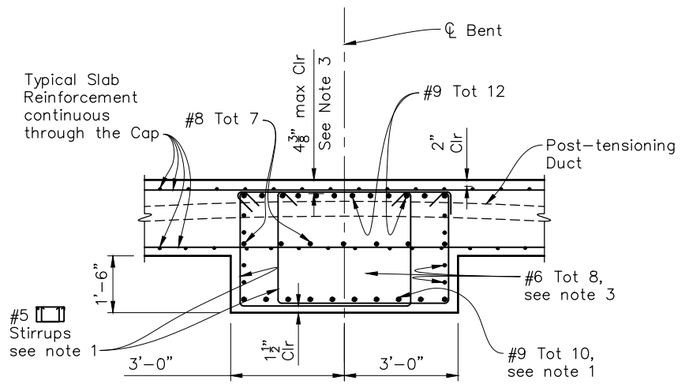
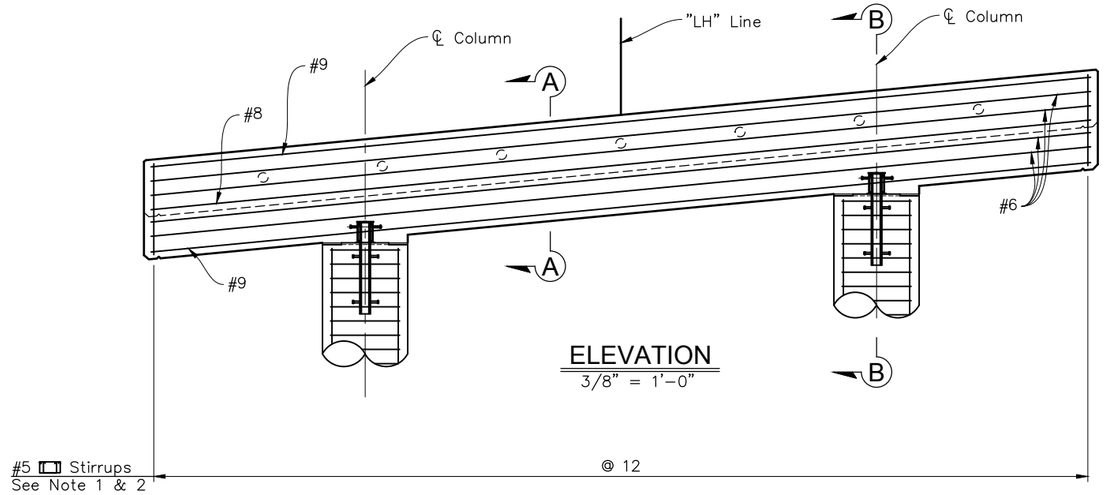
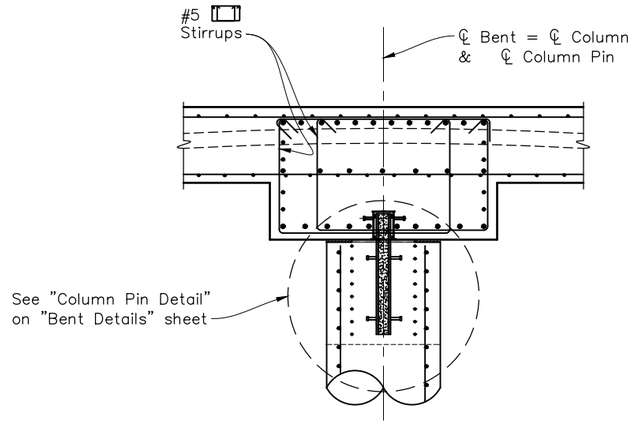
3/8" = 1'–0"



SECTION A-A
1/2" = 1'–0"



ELEVATION
3/8" = 1'–0"



SECTION B-B
1/2" = 1'–0"
See Note 1 & 2

Notes:

1. Adjust location of Bent Cap reinforcement to allow placement of Column Pin.
2. Section details drawn showing level Bent Cap. Cap bearing surface shall protrude below cap soffit due to non–level cap, as shown in elevation view.
3. Adjust location of side and top main bent cap reinf to avoid conflicts with P/S ducts as needed, but maintain clear cover as shown.
4. No splices allowed in any main bent cap reinforcement.

Notes:

For details not shown, see Section A–A.

PRESTRESSING NOTES

270 KSI Low Relaxation Strand:

P_{jack}	= 4650 kips
Anchor set	= $\frac{3}{8}$ in
Total Number of P/S Ducts	= 7

Distribution of prestress force (P_{jack}) between girders shall not exceed the ratio of 10:9.

Concrete: f'_c =4.0 psi @ 28 days

f'_{ci} =3.5 psi @ time of stressing

Contractor shall submit elongation calculations based on initial stress at

☒ =0.894 times jacking stress.

One end stressing shall be performed from either end.
